INVESTOR IN PEOPLE

The Patent Office
Concept House
Cardiff Road
Newport
South Wales
NP10 8QQ

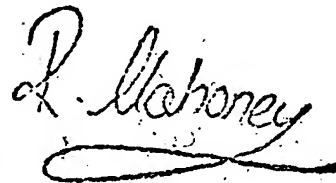

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Notes

Please type, or write in dark ink using CAPITAL letters. A prescribed fee is payable for a request for grant of a patent. For details, please contact the Patent Office (telephone 071-438 4700).

Rule 16 of the Patents Rules 1990 is the main rule governing the completion and filing of this form.

2 Do not give trading styles, for example, 'Trading as XYZ company', nationality or former names, for example, 'formerly (known as) ABC Ltd' as these are not required.

Warning

After an application for a Patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977 and will inform the applicant if such prohibition or restriction is necessary. Applicants resident in the United Kingdom are also reminded that under Section 23, applications may not be filed abroad without written permission unless an application has been filed not less than 6 weeks previously in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction revoked.

HISTAMINE RECEPTOR ANTAGONISTS

This invention relates to ~~the~~ a combination of a histamine H₁ receptor antagonist and a selective histamine H₄ receptor antagonist for the treatment of a range of diseases that may be treated by antagonism of either or both of the H₁ and H₄ receptors including allergic diseases and disorders such as allergic rhinitis and asthma, to the uses of, and to compositions, products and methods of treatment including, such a combination.

Allergies are widespread and affect a large proportion of the world population. They may be seasonal in nature and can be caused by a variety of factors present in the environment such as pollen, mites and dust particles.

Symptoms of allergic rhinitis, which may be seasonal or perennial, can include rhinorrhea, nasal congestion and irritation, often accompanied by coughing or sneezing. Irritation and soreness of the throat and eyes is also common. The level of severity of each symptom experienced may vary from representing a minor problem to a person experiencing a severe effect.

The use of a histamine H₁ receptor antagonist in the treatment of allergic rhinitis is well-documented but when administered alone it does not provide an effective relief for nasal blockage and such agents are therefore often administered concurrently with sympathomimetic amine decongestants such as phenylpropanolamine and pseudoephedrine. However, such concomitant therapy is not suitable for all patients since central nervous system and cardiovascular side effects are often observed. WO98/06394 discloses the use of a combination of a histamine H₁ receptor antagonist and a histamine H₃ receptor antagonist for the treatment of allergy-induced responses in the mammalian airway, including relief from nasal congestion.

There exists a need for additional effective treatments of allergic diseases and disorders such as allergic rhinitis and asthma. There is a particular need for an alternative therapy to provide relief from most, if not all, the symptoms of allergic rhinitis, including nasal congestion.

The present invention is based on the teaching of PCS10373APME that has been filed as European Patent Application no. 00309364.8 (Appendix I) in which, *inter alia*, a polynucleotide encoding for a polypeptide corresponding to a G-protein coupled receptor (GPCR), newly termed by other researchers the histamine H₄ receptor, are described and claimed. Although a compound that antagonises or selectively antagonises such a polypeptide is also disclosed in general terms, there is no definition or discussion of the meaning of selectivity. Further, there is no mention that antagonists of such a polypeptide may be used in combination with a histamine H₁ receptor antagonist. The teaching of this document is incorporated herein by reference. In the document the histamine H₄ receptor is defined as a polypeptide comprising:

- (a) a polypeptide having the deduced amino acid sequence translated from the polynucleotide sequence in SEQ ID NO: 1 and variants, fragments, homologues, analogues and derivatives thereof;
- (b) a polypeptide of SEQ ID NO: 2 and variants, fragments, homologues, analogues and derivatives thereof; or
- (c) a polypeptide encoded by the cDNA of NCIMB 41073 and variants, fragments, homologues, analogues and derivatives thereof.

The definitions of the above terms relating to the polypeptide are to be understood to be in conformity with the teaching of PCS10373APME (Appendix I) and, in particular, the terms "variant", "homologue", "fragment", "analogue" or "derivative" in relation to the amino acid sequence for the polypeptide include any substitution of, variation of, modification of, replacement of, deletion of or addition of one (or more) amino acid from or to the sequence providing the resultant polypeptide has GPCR activity, preferably being at least as biologically active as the polypeptide shown in attached SEQ ID NO: 2. In particular, the term "homologue" covers homology with respect to structure and/or function. With

respect to sequence homology, there is at least 70%, preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least 90%, more preferably at least 95% homology to the sequence shown in SEQ ID NO: 2. Most preferably there is at least 98% homology to the sequence shown in SEQ ID NO: 2.

This polypeptide corresponds to the orphan G-protein-coupled receptor encoded GPRv53, that has been surmised to be a novel histamine H₄ receptor, as described in The Journal of Biological Chemistry, 275(47), 36781-36786 (November 2000), the teaching of which is incorporated herein by reference.

We have surprisingly found that histamine-induced chemotaxis (migration towards a chemoattractant) of human eosinophils appears to be mediated by the histamine H₄ receptor and not by the histamine H₃ receptor and therefore that histamine H₄ receptor antagonists prevent histamine-induced chemotaxis of human eosinophils. Eosinophils have been implicated in the pathogenesis of inflammatory and allergic diseases such as asthma and allergic rhinitis and high levels of histamine are released in patients with these conditions. Histamine H₄ receptor antagonists may be advantageously used in treating such conditions since (i) they are likely to inhibit eosinophil infiltration into the nose and thus relieve nasal congestion by an additional or independent mechanism to antagonism of the histamine H₃ receptor, or (ii) by inhibiting eosinophil infiltration into the lung they are likely to reduce the inflammation associated with asthma and provide an effective alternative treatment for this disease.

A combination of a selective histamine H₄ receptor antagonist and a histamine H₁ receptor antagonist may be advantageously used to treat allergic rhinitis since it would treat all the main symptoms of this disease including nasal congestion. A combination of a selective histamine H₄ receptor antagonist and a histamine H₁ receptor antagonist may be advantageously used to treat asthma since it may improve lung function in a synergistic manner.

The present invention provides a combination of (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for

the histamine H₄ receptor as compared to the histamine H₃ receptor, for administration simultaneously, separately or sequentially, for use as a medicament for the treatment of a disease or disorder that may be treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as
5 allergic rhinitis or asthma.

The present invention further provides the use of a combination of (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, for administration simultaneously, separately or sequentially, for the
10 manufacture of a medicament for the treatment of a disease or disorder that may be treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma.

The present invention further provides a method of treatment of a mammal, including a human being, to treat a disease or disorder that may be
15 treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma including simultaneous, separate or sequential administration to the mammal of (a) an effective amount of a histamine H₁ receptor antagonist and (b) an effective amount of an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to
20 the histamine H₃ receptor.

The present invention further provides a pharmaceutical composition including (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, and, optionally, a pharmaceutically acceptable excipient,
25 diluent or carrier.

The present invention further provides a product containing (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor as a combined preparation for simultaneous, separate or sequential
30 use in the treatment of a disease or disorder that may be treated by antagonism

of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma.

The present invention further provides an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, to the uses of and compositions and methods of treatment including, such an antagonist. Such a selective antagonist has not been previously described and thioperamide and clobenpropit, both of which are histamine H₃ receptor antagonists, do not display this degree of selectivity.

The definition "an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor" as used herein means an antagonist that is at least 10-fold selective for the histamine H₄ receptor as defined in PCS10373APME (Appendix I) or as the orphan G-protein-coupled receptor encoded GPRv53 as disclosed in The Journal of Biological Chemistry, 275(47), 36781-36786 (November 2000) as described above, as compared to the known histamine H₃ receptor, by the biological assays described below.

Preferably, the antagonist is at least 30-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor.

Preferably, the antagonist is at least 50-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor.

Preferably, the antagonist is at least 100-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor.

Preferably, the antagonist is at least 1000-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor.

The definition "histamine H₁ receptor antagonist" is well-understood in the art and is in accordance therewith.

The diseases or disorders that may be treated with the present combination or antagonist include those which may be modulated by antagonism of the H₄ receptor such as those which concern aspects of signal transduction. Useful therapeutic areas include, but are not limited to, obesity, diabetes and metabolic disease, neurological disease, psychotherapeutics,

urogenital disease, reproduction and sexual medicine, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photoageing, frailty, osteoporosis, cardiovascular disease, gastrointestinal disease, anti-infection, allergy and respiratory disease, sensory organ disorders, sleep disorders and
5 hairloss.

Preferred diseases or disorders that may be treated are allergic disorders such as extrinsic asthma, rhinitis (allergic and chronic), onchocercal dermatitis, atopic dermatitis, drug reactions and NERDS (nodules, eosinophilia, rheumatism, dermatitis and swelling), vasculitic granulomatous diseases such
10 as temporal vasculitis, Churg-Strauss syndrome, polyarteritis, Wegner's granulomatosis and eosinophilic granulomatous prostatitis, immunological disorders such as autoimmune reactions (e.g. multiple sclerosis), graft rejection and intrinsic asthma, interstitial and other pulmonary diseases such as chronic obstructive pulmonary disease (COPD), eosinophilic pleural effusions, transient
15 pulmonary eosinophilic infiltrates (Loffler), histiocytosis, chronic eosinophilic pneumonia, hypersensitivity pneumonitis, allergic bronchopulmonary aspergillosis, sarcoidosis, idiopathic pulmonary fibrosis and topical eosinophilia, infectious parasitic diseases such as toxocariasis, filariasis, schistosomiasis, trichinosis, strongyloides, ascariasis and echinococcosis/cysticercosis, other
20 infectious diseases such as acute coccidioidomycosis, cat scratch disease, afebrile tuberculosis and chlamydial pneumonia at infancy, neoplastic and myeloproliferative diseases such as bronchogenic carcinoma, hypereosinophilic syndrome, T-cell lymphomas and Hodgkin's disease, inflammatory conditions such as inflammatory bowel diseases (e.g. ulcerative colitis, Crohn's disease)
25 and sinusitis, and coeliac disease, obstructive hepatic disease and dermatitis herpetiformis.

Particularly preferred diseases or disorders that may be treated are selected from the group consisting of asthma (both extrinsic and intrinsic), rhinitis (allergic and chronic), COPD and inflammatory bowel diseases, or that
30 consisting of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious

diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases. Preferably, said allergic disorder is extrinsic asthma or rhinitis (allergic or chronic), said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory
5 bowel diseases.

The selectivity of an antagonist for the histamine H_3 or H_4 receptor can be determined by the following procedures.

The cDNA for the human histamine H_3 and H_4 receptor can be expressed in a suitable cell line such as HEK293 or CHO. Affinity can be
10 assessed at either receptor by assessing the ability of ligands to inhibit the binding of a suitable radioactively labelled ligand to membranes containing either the histamine H_3 or H_4 receptor. The potency of compounds is compared by calculating their pK_i values.

The functional activity of ligands to determine agonist or antagonist
15 activity is determined in whole cells expressing either the H_3 or H_4 receptor. Agonists (full or partial) are identified as agents which inhibit forskolin stimulated cyclic AMP production which can be measured directly (as cyclic AMP) or indirectly as changes in beta-lactamase activity in cells co-expressing the CRE-beta-lactamase reporter system and the appropriate histamine
20 receptor. Agonist activities may be expressed as IC_{50} values. Inverse agonists can also be identified by the inhibition of the basal cAMP activity (i.e. in the absence of forskolin). Agents which have no effect on forskolin stimulated cAMP or inhibit basal cAMP may be antagonists and such activity can be measured in an assay where cells are pre-incubated with the ligand of interest
25 and their ability to inhibit H_3 or H_4 agonist-induced reduction of forskolin stimulated cyclic AMP is measured as described above. The experiments can be performed in one of two ways. Firstly, by increasing the concentration of antagonist *versus* fixed concentration of agonist and calculating the IC_{50} for each antagonist. Secondly, by increasing the concentration of antagonist
30 *versus* increasing the concentration of agonist and expressing the antagonist potency as a pK_b or pA_2 value, as appropriate.

A further functional assay for the histamine H₄ receptor determines the ability of histamine to induce chemotaxis in eosinophils isolated from human blood. In this assay cells are primed with interleukin 5 and the ability of histaminergic ligands to promote migration of eosinophils across a permeable membrane is studied. The number of cells migrating in a defined period is then counted. Agonist potencies are expressed as EC₅₀ values. Antagonists can also be studied by pre-incubating eosinophils with the compound and then assessing the inhibitory effects on histamine (or other suitable ligand) on eosinophil chemotaxis. The experiments can be performed in one of two ways. Firstly, by increasing the concentration of antagonist *versus* fixed concentration of agonist and calculating the IC₅₀ for each antagonist. Secondly, by increasing the concentration of antagonist *versus* increasing the concentration of agonist and expressing the antagonist potency as a pK_b or pA₂ value, as appropriate. Using this assay we have shown that histamine-induced chemotaxis of human eosinophils appears to be mediated by the histamine H₄ receptor and not by the histamine H₃ receptor.

The present combination (or each active element thereof) or antagonist can be administered alone but will generally be administered in admixture with a suitable pharmaceutical excipient, diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice.

For example, the present combination or antagonist can be administered orally, buccally or sublingually in the form of tablets, capsules, multi-particulates, gels, films, ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed-, modified-, sustained-, pulsed- or controlled-release applications. The present combination or antagonist may also be administered as fast-dispersing or fast-dissolving dosage forms or in the form of a high energy dispersion or as coated particles. Suitable formulations of the present combination or antagonist may be in coated or uncoated form, as desired.

Such solid pharmaceutical compositions, for example, tablets, may contain excipients such as microcrystalline cellulose, lactose, sodium citrate,

calcium carbonate, dibasic calcium phosphate, glycine and starch (preferably corn, potato or tapioca starch), disintegrants such as sodium starch glycolate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC),

- 5 hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

General Example

- 10 A formulation of a tablet could typically contain from 0.01mg to 500mg of each active element of the combination or of the antagonist whilst tablet fill weights may range from 50mg to 1000mg. An example of a formulation for a 10mg tablet is illustrated below:

15	<u>Ingredient</u>	<u>%w/w</u>
	Pharmaceutically active agent(s)	10.000*
	Lactose	64.125
	Starch	21.375
	Croscarmellose sodium	3.000
20	Magnesium Stearate	1.500

* Quantity adjusted in accordance with drug activity.

- The tablets are manufactured by a standard process, for example, direct
 25 compression or a wet or dry granulation process. The tablet cores may be coated with appropriate overcoats.

Solid compositions of a similar type may also be employed as fillers in gelatin or HPMC capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols.

- 30 For aqueous suspensions and/or elixirs, the present combination or antagonist

may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene glycol and glycerin, and combinations thereof.

5 The present combination or antagonist can also be administered parenterally, for example, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally, intrasternally, intracranially, intramuscularly or subcutaneously, or they may be administered by infusion or
10 needleless injection techniques. For such parenteral administration they are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The preparation of suitable parenteral
15 formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

 For oral and parenteral administration to human patients, the daily dosage level of each active element of the present combination or of the present antagonist will usually be from 0.01 to 50mg/kg body weight of the subject to be treated, preferably from 0.1 to 20mg/kg (in single or divided
20 doses), or they may be administered by intravenous infusion at a dose of from 0.001 to 10mg/kg/hour.

 For oral, parenteral, buccal or sublingual administration to a subject to be treated, the daily dosage level of each active element of the combination or of the antagonist may typically be from 10 to 500mg (in single or divided doses).
25 Thus tablets or capsules of the present combination or antagonist may contain from 5 to 100mg of each active element of the combination or of the antagonist for administration singly or two or more at a time, as appropriate. The physician in any event will determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the
30 particular patient. The above dosages are exemplary of the average case.

There can, of course, be individual instances where higher or lower dosage ranges are merited and such are within the scope of this invention.

The present combination or antagonist can also be administered intranasally or by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray, atomiser or nebuliser, with or without the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark]) or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide or other suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray, atomiser or nebuliser may contain a solution or suspension of the active compound(s), e.g. using a mixture of ethanol and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated to contain a powder mix of the present combination or antagonist and a suitable powder base such as lactose or starch.

Aerosol or dry powder formulations are preferably arranged so that each metered dose or "puff" contains from 10 μ g to 1mg of each active element of the present combination or antagonist for delivery to the patient. The overall daily dose with an aerosol will be in the range of from 10 μ g to 10mg of each active element of the present combination or antagonist which may be administered in a single dose or, more usually, in divided doses throughout the day.

Alternatively, the present combination or antagonist can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a gel, hydrogel, lotion, solution, cream, ointment or dusting powder. The present combination or antagonist may also be dermally or transdermally administered, for example, by the use of a skin patch. They may also be administered by the pulmonary or rectal routes.

They may also be administered by the ocular route, particularly for treating allergic conditions of the eye. For ophthalmic use, the compounds can be formulated as micronised suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline, optionally in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may be formulated in an ointment such as petrolatum.

For application topically to the skin, the present combination or antagonist can be formulated as a suitable ointment containing the active compound(s) suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

Each element of the present combination or the present antagonist may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion complexes with drug molecules. Formation of a drug-cyclodextrin complex may modify the solubility, dissolution rate, bioavailability and/or stability property of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes. As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary additive, e.g. as a carrier, diluent or solubiliser. Alpha-, beta- and gamma-cyclodextrins are most commonly used and suitable examples are described in WO-A-91/11172, WO-A-94/02518 and WO-A-98/55148.

The present invention embraces any other suitable formulations and administration routes described in PCS10373APME (Appendix I).

The present combination or antagonist can also be administered together with a steroid, a beta-adrenoceptor agonist, a muscarinic antagonist or a mucolytic.

The present combination, antagonist or composition can be used to treat
5 the above-mentioned conditions in humans or in other animals.

It is to be appreciated that all references herein to treatment include curative, palliative and prophylactic treatment.

It will be appreciated that what will be claimed is as follows:

1. A combination of (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, for administration simultaneously, separately or sequentially, for use as a medicament for the treatment of a disease or disorder that may be treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma.
2. The use of a combination of (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, for administration simultaneously, separately or sequentially, for the manufacture of a medicament for the treatment of a disease or disorder that may be treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma.
3. A method of treatment of a mammal, including a human being, to treat a disease or disorder that may be treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma including simultaneous, separate or sequential administration to the mammal of (a) an effective amount of a histamine H₁ receptor antagonist and (b) an effective amount of an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor.
4. A pharmaceutical composition including (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, and, optionally, a pharmaceutically acceptable excipient, diluent or carrier.

5. A product containing (a) a histamine H₁ receptor antagonist and (b) an antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor as a combined preparation for simultaneous, separate or sequential use in the treatment of a disease or disorder that may be treated by antagonism of either or both of the histamine H₁ and H₄ receptors such as allergic rhinitis or asthma.
6. An antagonist that is at least 10-fold selective for the histamine H₄ receptor as compared to the histamine H₃ receptor, or the use of, a composition or method of treatment including, such an antagonist.

The following document PCS10373APME has been filed as European Patent Application no. 00309364.8 and is attached as Appendix I.

NOVEL POLYPEPTIDE

Technical field

5

The present invention relates to a novel polynucleotide sequence which encodes a novel polypeptide belonging to the class of proteins known as G-protein coupled receptors (GPCRs). The present invention also relates, *inter alia*, to processes for producing the polypeptide and its uses.

10

Background of the invention

Cells and tissues respond to a wide variety of extracellular signalling molecules through the interaction of these molecules with specific cell-surface receptors. One such class of receptors are known as G-protein coupled receptors (GPCRs) and these are characterised by containing a series of 7 hydrophobic transmembrane segments. Upon binding an extracellular ligand to its receptor, intracellular signals are initiated via interactions with heterotrimeric G proteins which, in turn, can lead to a number of different intracellular events depending upon which receptor has been activated. For example some GPCRs influence adenylyl cyclase activity whereas others act via phospholipase C.

Members of the GPCR superfamily respond to a wide variety of ligands including small molecule amines (such as serotonin, dopamine, acetylcholine), lipid-derived mediators (such as LpA), amino acid derivatives (such as glutamate) and neurotransmitter peptides and hormones (such as neurokinin, galanin, glucagon, gastrin). Although GPCRs are activated by a broad range of ligands, it should be noted that individual GPCRs have a small and very specific repertoire of ligands. Based upon an analysis of the primary structure of a novel GPCR, it is now possible to classify them into specific sub-families, thereby narrowing the range of potential ligands.

In many cases, the endogenous ligands of GPCRs are relatively small, enabling them to be mimicked or blocked by synthetic analogues. For example drugs such as prazosin, doxazosin, cimetidine, ranitidine are all effective antagonists of their respective target
5 GPCRs.

Thus, as the modulation of GPCRs can have therapeutic consequences, there is a continued need to provide new GPCRs and their associated agonists and antagonists.

10

Summary aspects of the invention

In a broad aspect, the present invention relates to novel amino acid sequences. In this regard, a specific novel amino acid sequence has been isolated and it is to be understood
15 that the invention covers that sequence as well as novel variants, fragments, derivatives and homologues thereof.

In another broad aspect, the present invention relates to novel nucleic acid sequences. In this regard, a specific novel nucleic acid sequence has been isolated and it is to be
20 understood that the invention covers that sequence as well as novel variants, fragments, derivatives and homologues thereof.

Thus, in brief, some aspects of the present invention relate to:

- 25
1. Novel amino acids.
 2. Novel nucleotide sequences.
 3. Assays using said novel sequences.
 4. Compounds/compositions identified by use of said assays.
 5. Expression systems comprising or expressing said novel sequences.
 - 30 6. Methods of treatment based on said novel sequences.
 7. Pharmaceutical compositions based on said novel sequences.

Other aspects concerning the amino acid sequence of the present invention and/or the nucleotide sequence of the present invention include: a construct comprising or capable of expressing the sequences of the present invention; a vector comprising or capable of expressing the sequences of the present invention; a plasmid comprising or capable of expressing the sequences of the present invention; a cell transfected or virally-transduced with a construct/vector/plasmid comprising or capable of expressing the sequences of the present invention; a tissue comprising or capable of expressing the sequences of the present invention; an organ comprising or capable of expressing the sequences of the present invention; a transformed host comprising or capable of expressing the sequences of the present invention; and a transformed organism comprising or capable of expressing the sequences of the present invention. The present invention also encompasses methods of expressing the same, such as expression in a micro-organism; including methods for transferring the same.

For ease of reference, aspects of the present invention are now discussed under appropriate section headings. However, the teachings under each section are not necessarily limited to each particular section.

In the following commentary references to "nucleotide sequence of the present invention" and "amino acid sequence of the present invention" refer respectively to any one or more of the nucleotide sequences presented or discussed herein and to any one or more of the amino acid sequences presented or discussed herein. Also, and as used herein, "amino acid sequence" refers to peptide or protein sequences and may refer to portions thereof. In addition, the term "amino acid sequence of the present invention" is synonymous with the phrase "polypeptide sequence of the present invention". Also, the term "nucleotide sequence of the present invention" is synonymous with the phrase "polynucleotide sequence of the present invention".

Detailed aspects of the invention

According to one aspect of the present invention, there is provided an isolated and/or purified polynucleotide comprising one or more of:

5

- (a) a polynucleotide encoding the polypeptide as set forth in SEQ ID NO: 2;
- (b) a polynucleotide comprising a nucleotide sequence of SEQ ID NO: 1;
- (c) a polynucleotide encoding the polypeptide expressed by the DNA contained in NCIMB 41073;
- 10 (d) a polynucleotide comprising a nucleotide sequence that has at least 70% identity to the polynucleotide of any one of (a) to (c);
- (e) a polynucleotide comprising a nucleotide sequence which is capable of hybridising to the polynucleotide of any one of (a) to (d);
- (f) a complement to the polynucleotide of any one of (a) to (e); or
- 15 (g) a polynucleotide fragment of the polynucleotide of any one of (a) to (f).

Preferably, the polynucleotide comprises a nucleotide sequence that has at least 75% identity to the polynucleotide of any one of (a) to (c). More preferably, the polynucleotide comprises a nucleotide sequence that has at least 80% identity to the polynucleotide of any one of (a) to (c). Even more preferably, the polynucleotide comprises a nucleotide sequence that has at least 85% identity to the polynucleotide of any one of (a) to (c). Yet more preferably, the polynucleotide comprises a nucleotide sequence that has at least 90% identity to the polynucleotide of any one of (a) to (c). More preferably, the polynucleotide comprises a nucleotide sequence that has at least 95% identity to the polynucleotide of any one of (a) to (c). Most preferably, the polynucleotide comprises a nucleotide sequence that has at least 98% identity to the polynucleotide of any one of (a) to (c).

The polynucleotide described above preferably encodes a G-protein coupled receptor (GPCR).

30

The present invention also provides a polynucleotide probe or primer comprising at least 15 contiguous nucleotides of the polynucleotide described above.

5 The present invention yet further provides a vector comprising the polynucleotide described above.

According to a further aspect of the present invention, there is provided a host cell transformed or transfected with the vector described above. Preferably, the host cell is a mammalian, insect, fungal, bacterial or yeast cell.

10

According to a further aspect of the present invention, there is provided the transcribed RNA product of the polynucleotide described above. There is also provided an RNA molecule or a fragment thereof which is antisense in relation to the RNA product and is capable of hybridising thereto.

15

There is yet further provided a ribozyme or zinc finger protein capable of binding to the polynucleotide described above.

20 According to yet a further aspect of the present invention, there is provided a process for producing a polypeptide or fragment thereof comprising culturing said host cell under conditions sufficient for the expression of said polypeptide or fragment. Preferably, said polypeptide or fragment is expressed at the surface of said cell. The process preferably further includes recovering the polypeptide or fragment from the culture.

25 There is also provided by the present invention a process for producing cells capable of expressing a polypeptide or fragment thereof comprising transforming or transfecting cells with the vector described above.

30 According to a further embodiment of the present invention, there are provided cells produced by the process described above. There is also provided a membrane preparation of said cells.

According to another aspect of the present invention, there is provided a polypeptide comprising:

- 5 (a) a polypeptide having the deduced amino acid sequence translated from the polynucleotide sequence in SEQ ID NO: 1 and variants, fragments, homologues, analogues and derivatives thereof;
- (b) a polypeptide of SEQ ID NO: 2 and variants, fragments, homologues, analogues and derivatives thereof; or
- 10 (c) a polypeptide encoded by the cDNA of NCIMB 41073 and variants, fragments, homologues, analogues and derivatives thereof.

There is also provided by the present invention an antibody against the polypeptide described above.

- 15 The present invention yet further provides a compound, which modulates the polypeptide described above. Preferably, the compound antagonises or selectively antagonises the polypeptide. Alternatively, the compound agonises the polypeptide.

- 20 Also provided by the present invention is a pharmaceutical composition comprising the antibody or compound described above and one or more pharmaceutically acceptable carriers, diluents, adjuvants or excipients.

- 25 According to another aspect of the present invention, there is provided a method for identifying a compound, which binds to and modulates the polypeptide described above comprising contacting said polypeptide with a candidate compound and determining whether modulation occurs.

Preferably, said method comprises:

- 30 (a) contacting a compound with cells expressing the polypeptide described above on their cell surface, said polypeptide being associated with a second component capable of providing a detectable signal in response to

the binding of a compound to said polypeptide; said contacting being under conditions sufficient to permit binding of compounds to the polypeptide; and

- (b) identifying a compound capable of polypeptide binding by detecting the signal produced by said second component.

Alternatively, said method comprises:

- (a) contacting (i) a detectable first component known to bind to the polypeptide described above and (ii) a compound, with cells expressing the above polypeptide on their cell surface, said polypeptide being associated with a second component capable of providing a detectable signal in response to the binding of a compound to said polypeptide; said contacting being under conditions sufficient to permit binding of compounds to the polypeptide; and
- (b) determining whether the first component binds to the polypeptide by detecting the absence or otherwise of a signal generated from the interaction of the first component with the polypeptide.

- The compound identified by any of the above methods preferably binds to and (i) antagonises or selectively antagonises the polypeptide described above, or (ii) agonises the polypeptide described above.

- As GPCRs are involved in signal transduction, modulators (e.g. agonists or antagonists) of the polypeptide of the present invention can find use in interfering in the signal transduction process.

- Therefore, according to yet another embodiment of the present invention, there is provided the antibody, compound or composition described above for use as a pharmaceutical.

- Such antibodies, compounds and compositions, which can modulate the polypeptide of the present invention, can therefore find use in the therapeutic areas which concern aspects of signal transduction. Therapeutically usefully areas include, but are not limited to, obesity, diabetes and metabolic disease, neurological disease, 5 psychotherapeutics, urogenital disease, reproduction and sexual medicine, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photoageing, frailty, osteoporosis, cardiovascular disease, gastrointestinal disease, antiinfection, allergy and respiratory disease, sensory organ disorders, sleep disorders and hairloss.
- 10 Preferred conditions for treatment with such antibodies, compounds and compositions are allergic disorders such as extrinsic asthma, rhinitis (allergic and chronic), onchocercal dermatitis, atopic dermatitis, drug reactions, and NERDS (nodules, eosinophilia, rheumatism, dermatitis and swelling); vasculitic granulomatous diseases such as temporal vasculitis, Churg-Strauss syndrome, polyarteritis, Wegner's 15 granulomatosis, and eosinophilic granulomatous prostatitis; immunological disorders such as autoimmune reactions (e.g. multiple sclerosis), graft rejection, and intrinsic asthma; interstitial and other pulmonary diseases such as chronic obstructive pulmonary disease (COPD), eosinophilic pleural effusions, transient pulmonary eosinophilic infiltrates (Löffler), histiocytosis, chronic eosinophilic pneumonia, hypersensitivity 20 pneumonitis, allergic bronchopulmonary aspergillosis, sarcoidosis, idiopathic pulmonary fibrosis, and topical eosinophilia; infectious parasitic diseases such as toxocariasis, filariasis, schistosomiasis, trichinosis, strongyloides, ascariasis, and echinococcosis/cysticercosis; other infectious diseases such as acute coccidioidomycosis, cat scratch disease, afebrile tuberculosis, and chlamydial 25 pneumonia at infancy; neoplastic and myeloproliferative diseases such as bronchogenic carcinoma, hypereosinophilic syndrome, T-cell lymphomas and Hodgkin's disease; inflammatory conditions such as inflammatory bowel diseases (e.g. ulcerative colitis, Crohn's disease) and sinusitis; as well as coeliac disease, obstructive hepatic disease and dermatitis herpetiformis.
- 30 Especially preferred for treatment with such antibodies, compounds and compositions are asthma (both extrinsic and intrinsic), COPD, and inflammatory bowel diseases.

Accordingly, there is also provided the use of the compound described above in the manufacture of a medicament for the treatment of a patient having need to modulate the polypeptide described above. Preferably, the treatment is for a patient having need to
5 antagonise or selectively antagonise the polypeptide. Alternatively, the treatment is for a patient having need to agonise the polypeptide.

According to yet a further aspect of the invention, there is provided a method for the treatment of a patient having need to modulate the polypeptide described above
10 comprising administering to the patient a therapeutically effective amount of the above-described compound. Preferably, said method is for the treatment of a patient having need to antagonise or selectively antagonise the polypeptide. Alternatively, said method is for the treatment of a patient having need to agonise the polypeptide.

15 Preferably, said compound is a polypeptide and a therapeutically effective amount of the compound is administered by providing to the patient DNA encoding said compound and expressing said compound *in vivo*.

There is also provided by the present invention use of the antibody described above in
20 the manufacture of a medicament for the treatment of a patient having need to modulate the polypeptide described above. Preferably, said method is for the treatment of a patient having need to antagonise or selectively antagonise the polypeptide. Alternatively, said method is for the treatment of a patient having need to agonise the polypeptide.

25 Yet further provided by the present invention is a method for the treatment of a patient having need to modulate the polypeptide described above, comprising administering to the patient a therapeutically effective amount of the antibody described above. Preferably, said method is for the treatment of a patient having need to antagonise or
30 selectively antagonise the polypeptide. Alternatively, said method is for the treatment of a patient having need to agonise the polypeptide.

According to another aspect of the present invention, there is provided use of the above-described compound in the manufacture of a medicament for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases. Preferably, said allergic disorder is extrinsic asthma, said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.

There is also provided by the present invention use of the antibody described above in the manufacture of a medicament for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases. Preferably, said allergic disorder is extrinsic asthma, said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.

According to yet another aspect of the present invention, there is provided a method for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases, in a patient comprising administering to the patient a therapeutically effective amount of the compound described above. Preferably, said allergic disorder is extrinsic asthma, said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.

According to further aspect of the present invention, there is also provided a method for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases, in a patient comprising administering to the patient a therapeutically effective amount of the antibody described above. Preferably, said allergic disorder is extrinsic asthma, said immunological

disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.

There is also provided by the present invention the use of the above-mentioned antibody
5 for the enrichment or isolation of eosinophils from mammalian, preferably human blood.

According to a further aspect of the present invention, there are also provided cells genetically engineered *ex vivo* or *in vivo* to express, overexpress, underexpress or to
10 exhibit targeted insertion or deletion of the polypeptide of the present invention.

PFI-013 POLYPEPTIDE

As explained above, the present invention relates to a novel GPCR - which has been
15 internally designated PFI-013 - and to a nucleotide sequence encoding same. The present invention also relates to the use of the novel nucleic acid and amino acid sequences in the diagnosis and treatment of disease. The present invention also relates to the use of the novel nucleic acid and amino acid sequences to evaluate and/or to screen for agents that can modulate the GPCR. The present invention further relates to
20 genetically engineered host cells that comprise or express the novel nucleic acid and amino acid sequences to evaluate and/or to screen for agents that can modulate the GPCR.

The PFI-013 polypeptide may be the same as the naturally occurring form - for this
25 aspect, preferably the PFI-013 polypeptide is the non-native amino acid sequence (i.e. it is not present in its natural environment) - or is a variant, homologue, fragment or derivative thereof. In addition, or in the alternative, the PFI-013 polypeptide is isolated PFI-013 polypeptide and/or purified PFI-013 polypeptide. The PFI-013 polypeptide can be obtainable from or produced by any suitable source, whether natural or not, or it may
30 be synthetic, semi-synthetic or recombinant.

The PFI-013 coding sequence may be the same as the naturally occurring form - for this aspect, preferably the PFI-013 coding sequence is the non-native nucleotide sequence (i.e. it is not present in its natural environment) - or is a variant, homologue, fragment or derivative thereof. In addition, or in the alternative, the PFI-013 coding sequence is an isolated PFI-013 coding sequence and/or a purified PFI-013 coding sequence. The PFI-013 coding sequence can be obtainable from or produced by any suitable source, whether natural or not, or it may be synthetic, semi-synthetic or recombinant.

PFI-013 POLYPEPTIDE AND SCREENING

10

The PFI-013 polypeptide and/or its coding sequence and/or a sequence capable of hybridising thereto is/are useful for testing the selectivity of drug candidates between different GPCRs.

15 It has been demonstrated (herein) that PFI-013 is most closely similar to histamine receptors and that PFI-013 encodes a novel GPCR whose ligand is likely to be a small amine.

Drugs that modulate the novel PFI-013 receptor will therefore be likely to modulate signal transduction processes. It is therefore likely that modulators of the PFI-013 receptor may be useful for the treatment of many different disorders associated with signal transduction that will most likely include, but is not limited to, obesity, diabetes and metabolic disease, neurological disease, psychotherapeutics, urogenital disease, reproduction and sexual medicine, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photoageing, frailty, osteoporosis, cardiovascular disease, gastrointestinal disease, antiinfection, allergy and respiratory disease, sensory organ disorders, sleep disorders and hairloss.

Preferred conditions for treatment with such drugs are allergic disorders such as extrinsic asthma, rhinitis (allergic and chronic), onchocercal dermatitis, atopic dermatitis, drug reactions, and NERDS (nodules, eosinophilia, rheumatism, dermatitis and swelling); vasculitic granulomatous diseases such as temporal vasculitis, Churg-

Strauss syndrome, polyarteritis, Wegner's granulomatosis, and eosinophilic granulomatous prostatitis; immunological disorders such as autoimmune reactions (e.g. multiple sclerosis), graft rejection, and intrinsic asthma; interstitial and other pulmonary diseases such as chronic obstructive pulmonary disease (COPD),
5 eosinophilic pleural effusions, transient pulmonary eosinophilic infiltrates (Loffler), histiocytosis, chronic eosinophilic pneumonia, hypersensitivity pneumonitis, allergic bronchopulmonary aspergillosis, sarcoidosis, idiopathic pulmonary fibrosis, and topical eosinophilia; infectious parasitic diseases such as toxocariasis, filariasis, schistosomiasis, trichinosis, strongyloides, ascariasis, and echinococcosis/cysticercosis;
10 other infectious diseases such as acute coccidioidomycosis, cat scratch disease, afebrile tuberculosis, and chlamydial pneumonia at infancy; neoplastic and myeloproliferative diseases such as bronchogenic carcinoma, hypereosinophilic syndrome, T-cell lymphomas and Hodgkin's disease; inflammatory conditions such as inflammatory bowel diseases (e.g. ulcerative colitis, Crohn's disease) and sinusitis; as well as coeliac
15 disease, obstructive hepatic disease and dermatitis herpetiformis.

Especially preferred conditions for treatment with such drugs are asthma (both extrinsic and intrinsic), COPD, and inflammatory bowel diseases.

20 Thus, the PFI-013 polypeptide and/or its coding sequence and/or a sequence capable of hybridising thereto may be useful for screening drug candidates for the treatment of diseases associated with signal transduction. In addition, it is believed that PFI-013 polypeptide and/or its coding sequence and/or a sequence capable of hybridising thereto may be useful for screening drug candidates for the treatment of diseases such as those
25 described above.

Either or both of the nucleotide sequences coding for the PFI-013 polypeptide or the PFI-013 polypeptide itself may be used to screen for agents that can affect GPCR activity. In particular, the nucleotide sequence coding for the PFI-013 receptor itself may be used
30 to screen for agents that can antagonise GPCR activity. In addition, the nucleotide sequence coding for PFI-013 polypeptide or the PFI-13 polypeptide itself may be used to

screen for agents that selectively affect GPCR activity, such as selectively antagonise the PFI-013 receptor.

POLYPEPTIDE OF THE PRESENT INVENTION

5

The term "polypeptide" - which is interchangeable with the term "protein" - includes single-chain polypeptide molecules as well as multiple-polypeptide complexes where individual constituent polypeptides are linked by covalent or non-covalent means.

10 Preferably, the polypeptide of the present invention is a single-chain polypeptide.

Polypeptides of the present invention may be in a substantially isolated form. It will be understood that the polypeptide may be mixed with carriers or diluents which will not interfere with the intended purpose of the polypeptide and still be regarded as substantially isolated. A polypeptide of the present invention may also be in a substantially purified form, in which case it will generally comprise the polypeptide in a preparation in which more than 90%, e.g. 95%, 98% or 99% of the polypeptide in the preparation is a polypeptide of the present invention. Polypeptides of the present invention may be modified for example by the addition of histidine residues to assist their purification.

Polypeptides of the present invention may be produced by synthetic means (e.g. as described by Geysen *et al.*, 1996) or recombinantly, as described below.

25 In a preferred embodiment, the amino acid sequence *per se* of the present invention does not cover the native PFI-013 receptor according to the present invention when it is in its natural environment and when it has been expressed by its native nucleotide coding sequence which is also in its natural environment and when that nucleotide sequence is under the control of its native promoter which is also in its natural environment. For ease of reference, we have called this preferred embodiment the "non-native amino acid sequence".

The terms "variant", "homologue", "fragment", "analogue" or "derivative" in relation to the amino acid sequence for the polypeptide of the present invention include any substitution of, variation of, modification of, replacement of, deletion of or addition of one (or more) amino acid from or to the sequence providing the resultant polypeptide has GPCR activity, preferably being at least as biologically active as the polypeptide shown in attached SEQ ID NO: 2. In particular, the term "homologue" covers homology with respect to structure and/or function. With respect to sequence homology, there is at least 70%, preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least 90%, more preferably at least 95% homology to the sequence shown in SEQ ID NO: 2. Most preferably there is at least 98% homology to the sequence shown in SEQ ID NO: 2.

Typically, for the variant, homologue or fragment of the present invention, the types of amino acid substitutions that could be made should maintain the hydrophobicity/hydrophilicity of the amino acid sequence. Amino acid substitutions may be made, for example from 1, 2 or 3 to 10, 20 or 30 substitutions provided that the modified sequence retains the ability to act as a GPCR in accordance with the present invention. Amino acid substitutions may include the use of non-naturally occurring analogues.

20

The amino acid sequence of the present invention may be produced by expression of a nucleotide sequence coding for same in a suitable expression system.

In addition, or in the alternative, the protein itself could be produced using chemical methods to synthesize a PFI-013 polypeptide, in whole or in part. For example, peptides can be synthesized by solid phase techniques, cleaved from the resin, and purified by preparative high performance liquid chromatography (e.g. Creighton (1983) Proteins Structures and Molecular Principles, WH Freeman and Co., New York, NY, USA). The composition of the synthetic peptides may be confirmed by amino acid analysis or sequencing (e.g. the Edman degradation procedure).

30

Direct peptide synthesis can be performed using various solid-phase techniques (Roberge JY *et al* Science Vol 269 1995 202-204) and automated synthesis may be achieved, for example, using the ABI 431 A Peptide Synthesizer (Perkin Elmer) in accordance with the instructions provided by the manufacturer. Additionally, the amino acid sequence of PFI-013, or any part thereof, may be altered during direct synthesis and/or combined using chemical methods with a sequence from other subunits, or any part thereof, to produce a variant polypeptide.

In another embodiment of the invention, a PFI-013 natural, modified or recombinant amino acid sequence may be ligated to a heterologous sequence to encode a fusion protein. For example, for screening of libraries for compounds and peptide agonists and antagonists of PFI-013 GPCR activity, it may be useful to encode a chimeric PFI-013 protein expressing a heterologous epitope that is recognised by a commercially available antibody. A fusion protein may also be engineered to contain a cleavage site located between a PFI-013 sequence and the heterologous protein sequence, so that the PFI-013 may be cleaved and purified away from the heterologous moiety.

PFI-013 may also be expressed as a recombinant protein with one or more additional polypeptide domains added to facilitate protein purification. Such purification facilitating domains include, but are not limited to, metal chelating peptides such as histidine-tryptophan modules that allow purification on immobilised metals (Porath J, Protein Expr Purif Vol 3 1992 p263-281), protein A domains that allow purification on immobilised immunoglobulin, and the domain utilised in the FLAGS extension/affinity purification system (Immunex Corp, Seattle, WA, USA). The inclusion of a cleavable linker sequence such as Factor XA or enterokinase (Invitrogen, San Diego, CA, USA) between the purification domain and PFI-013 is useful to facilitate purification.

A specific amino acid sequence of PFI-013 is shown in SEQ ID NO: 2. However, the present invention encompasses amino acid sequences encoding other GPCRs which would include amino acid sequences having at least 70% identity (preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least

90%, more preferably at least 95%, most preferably at least 98% identity) to that specific amino acid sequence.

Polypeptides of the present invention also include fragments of the present amino acid sequence and variants thereof. Suitable fragments will be at least 5, e.g. at least 10, 12, 15 or 20 amino acids in size.

Polypeptides of the present invention may also be modified to contain one or more (e.g. at least 2, 3, 5, or 10) substitutions, deletions or insertions, including conserved substitutions. These aspects are discussed in a later section.

NUCLEOTIDE SEQUENCE OF THE PRESENT INVENTION

The term "nucleotide sequence" as used herein refers to an oligonucleotide sequence or polynucleotide sequence, and variants, homologues, fragments, analogues and derivatives thereof (such as portions thereof). The nucleotide sequence may be DNA or RNA which may be of genomic or synthetic or recombinant origin which may be double-stranded or single-stranded whether representing the sense or antisense strand.

Preferably, the term "nucleotide sequence" means DNA.

More preferably, the term "nucleotide sequence" means DNA prepared by use of recombinant DNA techniques (i.e. recombinant DNA).

In a preferred embodiment, the nucleotide sequence *per se* of the present invention does not cover the native nucleotide coding sequence according to the present invention in its natural environment when it is under the control of its native promoter which is also in its natural environment. For ease of reference, we have called this preferred embodiment the "non-native nucleotide sequence".

30

The nucleotide sequences of the present invention may include within them synthetic or modified nucleotides. A number of different types of modification to oligonucleotides

are known in the art. These include methylphosphonate and phosphorothioate backbones, addition of acridine or polylysine chains at the 3' and/or 5' ends of the molecule. For the purposes of the present invention, it is to be understood that the nucleotide sequences described herein may be modified by any method available in the art. Such modifications may be carried out in to enhance the *in vivo* activity or life span of nucleotide sequences of the present invention.

The present invention also encompasses nucleotide sequences that are complementary to the sequences presented herein, or any variant, homologue, analogue, fragment or derivative thereof. If the sequence is complementary to a fragment thereof then that sequence can be used a probe to identify similar coding sequences in other organisms, etc.

The present invention also encompasses nucleotide sequences that are capable of hybridising to the sequences presented herein, or any variant, homologue, analogue, fragment or derivative thereof.

The present invention also encompasses nucleotide sequences that are capable of hybridising to the sequences that are complementary to the sequences presented herein, or any variant, homologue, analogue, fragment or derivative thereof.

The term "variant" also encompasses sequences that are complementary to sequences that are capable of hybridising to the nucleotide sequences presented herein.

Preferably, the term "variant" encompasses sequences that are complementary to sequences that are capable of hybridising under stringent conditions (e.g. 65°C and 0.1xSSC {1xSSC = 0.15 M NaCl, 0.015 M citrate pH 7.0}) to the nucleotide sequences presented herein.

The present invention also relates to nucleotide sequences that can hybridise to the nucleotide sequences of the present invention (including complementary sequences of those presented herein).

The present invention also relates to nucleotide sequences that are complementary to sequences that can hybridise to the nucleotide sequences of the present invention (including complementary sequences of those presented herein).

- 5 Also included within the scope of the present invention are polynucleotide sequences that are capable of hybridising to the nucleotide sequences presented herein under conditions of intermediate to maximal stringency.

In a preferred aspect, the present invention covers nucleotide sequences that can hybridise
10 to the nucleotide sequence of the present invention, or the complement thereof, under stringent conditions (e.g. 65°C and 0.1xSSC).

Exemplary nucleic acids can alternatively be characterised as those nucleotide sequences which encode a PFI-013 protein and hybridise to the DNA sequence shown in
15 SEQ ID NO: 1. Preferred are such sequences encoding PFI-013 which hybridise under high-stringency conditions to the sequence shown in SEQ ID NO: 1 or the complement thereof.

Advantageously, the invention provides nucleic acid sequences which are capable of
20 hybridising, under stringent conditions, to a fragment of the sequence shown in the SEQ ID NO: 1 or the complement thereof. Preferably, the fragment is between 15 and 50 bases in length. Advantageously, it is about 25 bases in length.

The terms "variant", "homologue", "analogue", "derivative" or "fragment" in relation to
25 the nucleotide sequence coding for the preferred polypeptide of the present invention include any substitution of, variation of, modification of, replacement of, deletion of or addition of one (or more) nucleic acid from or to the sequence providing the resultant nucleotide sequence codes for or is capable of coding for an polypeptide having PFI-013 receptor activity, preferably being at least as biologically active as the polypeptide
30 encoded by the sequence shown in SEQ ID NO: 1. In particular, the term "homologue" covers homology with respect to structure and/or function providing the resultant nucleotide sequence codes for or is capable of coding for a polypeptide having activity as

a PFI-013 GPCR. With respect to sequence homology, preferably there is at least 70%, preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least 90%, more preferably at least 95% homology to a nucleotide sequence coding for the amino acid sequence shown in SEQ ID NO: 2. Most preferably there is at least 98% homology to a nucleotide sequence coding for the amino acid sequence shown in SEQ ID NO: 2. With respect to sequence homology, there is at least 70%, preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least 90%, more preferably at least 95% homology to the nucleotide sequence shown in SEQ ID NO: 1. Most preferably there is at least 98% homology to the nucleotide sequence shown in SEQ ID NO: 1.

As indicated, the present invention relates to a DNA sequence (preferably a cDNA sequence) encoding PFI-013. In particular, the present invention relates to cDNA sequences encoding PFI-013.

The present invention also relates to DNA segments comprising the DNA sequence shown in SEQ ID NO: 1 or allelic variations thereof.

The present invention also relates to polypeptides produced by expression in a host cell into which has been incorporated the foregoing DNA sequences or allelic variations thereof.

The present invention also relates provides DNA comprising the DNA sequence shown in SEQ ID NO: 1 or allelic variations thereof.

The present invention also relates to non-native DNA comprising the DNA sequence shown in SEQ ID NO: 1 or allelic variations thereof.

A highly preferred aspect of the present invention relates to recombinant DNA comprising the DNA sequence shown in SEQ ID NO: 1 or allelic variations thereof.

Polynucleotides of the present invention include nucleic acid sequences encoding the polypeptides of the present invention. It will be appreciated that a range of different polynucleotides encode a given amino acid sequence as a consequence of the degeneracy of the genetic code.

5

By knowledge of the amino acid sequences set out herein it is possible to devise partial and full-length nucleic acid sequences such as cDNA and/or genomic clones that encode the polypeptides of the present invention. For example, polynucleotides of the present invention may be obtained using degenerate polymerase chain reaction (PCR) which
10 will use primers designed to target sequences encoding the amino acid sequences presented herein. The primers will typically contain multiple degenerate positions. However, to minimise degeneracy, sequences will be chosen that encode regions of the amino acid sequences presented herein containing amino acids such as methionine which are coded for by only one triplet. In addition, sequences will be chosen to take
15 into account codon usage in the organism whose nucleic acid is used as the template DNA for the PCR procedure. PCR will be used at stringency conditions lower than those used for cloning sequences with single sequence (non-degenerate) primers against known sequences.

20 Nucleic acid sequences obtained by PCR that encode polypeptide fragments of the present invention may then be used to obtain larger sequences using hybridisation library screening techniques. For example a PCR clone may be labelled with radioactive atoms and used to screen a cDNA or genomic library from other species, preferably other mammalian species. Hybridisation conditions will typically be
25 conditions of medium to high stringency (for example 0.03M sodium chloride and 0.03M sodium citrate at from about 50°C to about 60°C).

Degenerate nucleic acid probes encoding all or part of the amino acid sequence may also be used to probe cDNA and/or genomic libraries from other species, preferably
30 other mammalian species. However, it is preferred to carry out PCR techniques initially to obtain a single sequence for use in further screening procedures.

In accordance with the present invention, polynucleotide sequences which encode PFI-013, fragments of the polypeptide, fusion proteins or functional equivalents thereof, may be used to generate recombinant DNA molecules that direct the expression of PFI-013 in appropriate host cells. Due to the inherent degeneracy of the genetic code, other
5 DNA sequences which encode substantially the same or a functionally equivalent amino acid sequence, may be used to clone and express PFI-013. As will be understood by those of skill in the art, it may be advantageous to produce PFI-013-encoding nucleotide sequences possessing non-naturally occurring codons. Codons preferred by a particular prokaryotic or eukaryotic host (Murray E *et al* (1989) Nuc Acids Res 17:477-508) can
10 be selected, for example, to increase the rate of PFI-013 expression or to produce recombinant RNA transcripts having desirable properties, such as a longer half-life, than transcripts produced from naturally occurring sequence.

Polynucleotide sequences of the present invention obtained using the techniques
15 described above may be used to obtain further homologous sequences and variants using the techniques described above. They may also be modified for use in expressing the polypeptides of the present invention in a variety of host cells systems, for example to optimise codon preferences for a particular host cell in which the polynucleotide sequences are being expressed. Other sequence changes may be desired in order to
20 introduce restriction enzyme recognition sites, or to alter the property or function of the polypeptides encoded by the polynucleotides.

Altered PFI-013 polynucleotide sequences which may be used in accordance with the invention include deletions, insertions or substitutions of different nucleotide residues
25 resulting in a polynucleotide that encodes the same or a functionally equivalent PFI-013. The protein may also have deletions, insertions or substitutions of amino acid residues which produce a silent change and result in a functionally equivalent PFI-013. Deliberate amino acid substitutions may be made on the basis of similarity in polarity, charge, solubility, hydrophobicity, hydrophilicity, and/or the amphipathic nature of the
30 residues as long as the biological activity of PFI-013 is retained. For example, negatively charged amino acids include aspartic acid and glutamic acid; positively charged amino acids include lysine and arginine; and amino acids with uncharged polar

head groups having similar hydrophilicity values include leucine, isoleucine, valine, glycine, alanine, asparagine, glutamine, serine, threonine, phenylalanine, and tyrosine.

Included within the scope of the present invention are alleles of PFI-013. As used
5 herein, an "allele" or "allelic sequence" is an alternative form of PFI-013. Alleles result from a mutation, i.e. a change in the nucleic acid sequence, and generally produce altered mRNAs or polypeptides whose structure or function may or may not be altered. Any given gene may have none, one or many allelic forms. Common mutational changes which give rise to alleles are generally ascribed to deletions, additions or
10 substitutions of amino acids. Each of these types of changes may occur alone, or in combination with the others, one or more times in a given sequence.

The nucleotide sequences of the present invention may be engineered in order to alter a PFI-013 coding sequence for a variety of reasons, including but not limited to,
15 alterations which modify the cloning, processing and/or expression of the gene product. For example, mutations may be introduced using techniques which are well known in the art, e.g. site-directed mutagenesis to insert new restriction sites, to alter glycosylation patterns or to change codon preference.

20 Polynucleotides of the present invention may be used to produce a primer, e.g. a PCR primer, a primer for an alternative amplification reaction, a probe e.g. labelled with a revealing label by conventional means using radioactive or non-radioactive labels, or the polynucleotides may be cloned into vectors. Such primers, probes and other fragments will be at least 15, preferably at least 20, for example at least 25, 30 or 40 nucleotides in
25 length, and are also encompassed by the term polynucleotides of the present invention as used herein.

Polynucleotides or primers of the present invention may carry a revealing label. Suitable labels include radioisotopes such as ^{32}P or ^{35}S , enzyme labels, or other protein
30 labels such as biotin. Such labels may be added to polynucleotides or primers of the present invention and may be detected using by techniques known in the art.

Polynucleotides such as a DNA polynucleotide and primers according to the present invention may be produced recombinantly, synthetically, or by any means available to those of skill in the art. They may also be cloned by standard techniques.

- 5 In general, primers will be produced by synthetic means, involving a step-wise manufacture of the desired nucleic acid sequence one nucleotide at a time. Techniques for accomplishing this using automated techniques are readily available in the art.

- 10 Longer polynucleotides will generally be produced using recombinant means, for example using PCR cloning techniques. This will involve making a pair of primers (e.g. of about 15-30 nucleotides) to a region of the nucleotide sequence which it is desired to clone, bringing the primers into contact with mRNA or cDNA obtained from a eukaryotic or prokaryotic cell, performing a polymerase chain reaction under conditions which bring about amplification of the desired region, isolating the amplified
15 fragment (e.g. by purifying the reaction mixture on an agarose gel) and recovering the amplified DNA. The primers may be designed to contain suitable restriction enzyme recognition sites so that the amplified DNA can be cloned into a suitable cloning vector.

- DNA molecules may be modified to increase intracellular stability and half-life.
20 Possible modifications include, but are not limited to, the addition of flanking sequences of the 5' and/or 3' ends of the molecule or the use of phosphorothioate or 2' O-methyl rather than phosphodiesterase linkages within the backbone of the molecule.

- As mentioned earlier, the present invention also relates to nucleotide sequences that are
25 capable of hybridising to all or part of the sequence shown in SEQ ID NO: 1 or an allelic variation thereof. These nucleotide sequences may be used in antisense techniques to modify PFI-013 expression. Alternatively, these sequences (or portions thereof) can be used as a probe, or for amplifying all or part of such sequence when used as a PCR primer.

- 30 In addition to the recombinant DNA sequences, genomic sequences are also of utility in the context of drug discovery. It may be valuable to inhibit the mRNA transcription of a particular isoform rather than to inhibit its translated protein. This may be true with PFI-

013, if there are splice variants and wherein those different splice variants may be transcribed from different promoters.

Another utility of the invention is that the DNA sequences, once known, give the information needed to design assays to specifically detect isoforms or splice variants. Isoform-specific PCR primer pairs are but one example of an assay that depends completely on the knowledge of the specific DNA sequence of the isoform or splice variant. Such an assay allows detection of mRNA for the isoform to access the tissue distribution and biological relevance of each isoform to a particular disease state. It also allows identification of cell lines that may naturally express only one isoform - a discovery that might obviate the need to express recombinant genes. If specific PFI-013 isoforms are shown to be associated with a particular disease state, the invention would be valuable in the design of diagnostic assays to detect the presence of isoform mRNA.

An abnormal level of nucleotide sequences encoding a PFI-013 receptor in a biological sample may reflect a chromosomal aberration, such as a nucleic acid deletion or mutation. Accordingly, nucleotide sequences encoding a PFI-013 receptor provide the basis for probes which can be used diagnostically to detect chromosomal aberrations such as deletions, mutations or chromosomal translocations in the gene encoding PFI-013. PFI-013 gene expression may be altered in such disease states or there may be a chromosomal aberration present in the region of the gene encoding PFI-013.

In an alternative embodiment of the invention, the coding sequence of PFI-013 could be synthesized, in whole or in part, using chemical methods well known in the art (see Caruthers MH *et al* (1980) Nuc Acids Res Symp Ser 215-23, Horn T *et al* (1980) Nuc Acids Res Symp Ser 225-232).

NATURALLY OCCURRING

As used herein "naturally occurring" refers to a PFI-013 with an amino acid sequence found in nature.

ISOLATED/PURIFIED

As used herein, the terms "isolated" and "purified" refer to molecules, either nucleic or amino acid sequences, that are removed from their natural environment and isolated or
5 separated from at least one other component with which they are naturally associated.

BIOLOGICALLY ACTIVE

As used herein "biologically active" refers to a PFI-013 according to the present
10 invention - such as a recombinant PFI-013- having a similar structural function (but not necessarily to the same degree), and/or similar regulatory function (but not necessarily to the same degree), and/or similar biochemical function (but not necessarily to the same degree) and/or immunological activity (but not necessarily to the same degree) of the naturally occurring PFI-013. Specifically, a PFI-013 of the present invention has the
15 ability to act as a GPCR, which is one of the characteristic activities of the PFI-013 polypeptide of the present invention.

IMMUNOLOGICAL ACTIVITY

20 As used herein, "immunological activity" is defined as the capability of the natural, recombinant or synthetic PFI-013 or any oligopeptide thereof, to induce a specific immune response in appropriate animals or cells and to bind with specific antibodies.

DERIVATIVE

25

The term "derivative" as used herein in relation to the amino acid sequence includes chemical modification of a PFI-013. Illustrative of such modifications would be replacement of hydrogen by an alkyl, acyl, or amino group.

30

ANALOGUE

The term "analogue" as used herein in relation to the amino acid sequence (or the coding sequence thereof) includes chemical modification of a PFI-013 or the coding
5 sequence thereof. Illustrative of such modifications would be replacement of natural amino acid residues or natural nucleotides with non-natural amino acid residues (e.g. D-amino acids, beta-alanine, hydroxyproline) or non-natural nucleotides (e.g. inosine, demethyl-cytidine).

10 DELETION

As used herein a "deletion" is defined as a change in either nucleotide or amino acid sequence in which one or more nucleotides or amino acid residues, respectively, are
absent.

15

INSERTION/ADDITION

As used herein an "insertion" or "addition" is a change in a nucleotide or amino acid sequence which has resulted in the addition of one or more nucleotides or amino acid
20 residues, respectively, as compared to the naturally occurring PFI-013.

SUBSTITUTION

As used herein "substitution" results from the replacement of one or more nucleotides or
25 amino acids by different nucleotides or amino acids, respectively.

HOMOLOGUE

The term "homologue" with respect to the nucleotide sequence of the present invention
30 and the amino acid sequence of the present invention may be synonymous with allelic variations of the sequences.

In particular, the term "homology" as used herein may be equated with the term "identity". Here, sequence homology with respect to the nucleotide sequence of the present invention and the amino acid sequence of the present invention can be determined by a simple "eyeball" comparison (i.e. a strict comparison) of any one or more of the sequences with another sequence to see if that other sequence has at least 70% identity to the nucleotide and amino acid sequences. Relative sequence homology (i.e. sequence identity) can also be determined by commercially available computer programs that can calculate percentage (%) homology between two or more sequences. Typical examples of such computer programs are FASTA or BLAST.

10

An alternative method for producing sequence alignments is to use the computer program ClustalW (Thompson J.D., Higgins D.G. and Gibson T.J., *Nucleic Acid Research*, Vol. 22 (22); 4673-4680 (1994)).

15 Percentage (%) homology may be calculated over contiguous sequences, i.e. one sequence is aligned with the other sequence and each amino acid in one sequence directly compared with the corresponding amino acid in the other sequence, one residue at a time. This is called an "ungapped" alignment. Typically, such ungapped alignments are performed only over a relatively short number of residues (for example less than 50 contiguous amino acids).

20

Although this is a very simple and consistent method, it fails to take into consideration that, for example, in an otherwise identical pair of sequences, one insertion or deletion will cause the following amino acid residues to be put out of alignment, thus potentially resulting in a large reduction in % homology when a global alignment is performed. Consequently, most sequence comparison methods are designed to produce optimal alignments that take into consideration possible insertions and deletions without penalising unduly the overall homology score. This is achieved by inserting "gaps" in the sequence alignment to try to maximise local homology.

25
30

However, these more complex methods assign "gap penalties" to each gap that occurs in the alignment so that, for the same number of identical amino acids, a sequence alignment

with as few gaps as possible - reflecting higher relatedness between the two compared sequences - will achieve a higher score than one with many gaps. "Affine gap costs" are typically used that charge a relatively high cost for the existence of a gap and a smaller penalty for each subsequent residue in the gap. This is the most commonly used gap scoring system. High gap penalties will of course produce optimised alignments with fewer gaps. Most alignment programs allow the gap penalties to be modified. However, it is preferred to use the default values when using such software for sequence comparisons. For example when using the GCG Wisconsin Bestfit package (see below) the default gap penalty for amino acid sequences is -12 for a gap creation and -4 for each extension. Alternative default gap penalties for amino acid sequences is -8 for a gap creation and -2 for each extension.

Calculation of maximum % homology therefore firstly requires the production of an optimal alignment, taking into consideration gap penalties. A suitable computer program for carrying out such an alignment is the GCG Wisconsin Bestfit package (University of Wisconsin, U.S.A.; Devereux *et al.*, 1984, Nucleic Acids Research 12:387). Examples of other software that can perform sequence comparisons include, but are not limited to, the BLAST package (see Ausubel *et al.*, 1999 *ibid* - Chapter 18), FASTA (Altschul *et al.*, 1990, J. Mol. Biol., 403-410) and the GENWORKS suite of comparison tools. Both BLAST and FASTA are available for off-line and on-line searching (see Ausubel *et al.*, 1999 *ibid*, pages 7-58 to 7-60). However, for some applications it is preferred to use the GCG Bestfit program.

Although the final % homology can be measured in terms of identity, in some cases, the alignment process itself is typically not based on an all-or-nothing pair comparison. Instead, a scaled similarity score matrix is generally used that assigns scores to each pairwise comparison based on chemical similarity or evolutionary distance. An example of such a matrix commonly used is the BLOSUM62 matrix - the default matrix for the BLAST suite of programs. GCG Wisconsin programs generally use either the public default values or a custom symbol comparison table if supplied (see user manual for further details). It is preferred to use the public default values for the GCG package, or in the case of other software, the default matrix, such as BLOSUM62.

Once the software has produced an optimal alignment, it is possible to calculate % homology, preferably % sequence identity. The software typically does this as part of the sequence comparison and generates a numerical result.

5

As indicated, for some applications, sequence homology (or identity) may be determined using any suitable homology algorithm, using for example default parameters. For a discussion of basic issues in similarity searching of sequence databases, see Altschul *et al.* (1994) Nature Genetics 6:119-129. For some applications, the BLAST algorithm is employed, with parameters set to default values. The BLAST algorithm is described in detail at http://www.ncbi.nih.gov/BLAST/blast_help.html. Advantageously, "substantial homology", when assessed by BLAST, equates to sequences which match with an EXPECT value of at least about e^{-7} , preferably at least about e^{-9} and most preferably e^{-10} or lower. The default threshold for EXPECT in BLAST searching is usually 10.

15

Should Gap Penalties be used when determining sequence identity, then preferably the following parameters are used:

FOR BLAST	
GAP OPEN	5
GAP EXTENSION	2

20

FOR CLUSTAL	DNA	PROTEIN	
WORD SIZE	2	1	K triple
GAP PENALTY	10	10	
GAP EXTENSION	0.1	0.1	

Other computer program methods to determine identity and similarity between the two sequences include but are not limited to the GCG program package (Devereux *et al.*,

1984 Nucleic Acids Research 12: 387) and FASTA (Altschul *et al.* 1990 J Molec Biol 403-410).

PROFILE HIDDEN MARKOV MODELS

5

The profile of a family of sequences can be modelled in a probabilistic way using hidden Markov models (HMMs) (Durbin, R., Eddy, S., Krogh, A. and Mitchison, G. (1998), Biological Sequence Analysis: Probabilistic models of proteins and nucleic acids; Cambridge University Press, Cambridge, UK.; Eddy, S.R. (1998), Profile hidden Markov models; *Bioinformatics*, 14: 755-763). HMMs were originally developed for use in speech recognition and have since been used for a range of signal processing applications. A signal is modelled as a sequence of elements from a finite set. In speech recognition this set consists of the sounds that make up the language and the aim is to deduce what words the sounds represent. A protein sequence from a particular family can be thought of in the same way. The sequence is a series of elements from the set of 20 amino acids and the requirement is to determine what protein family the sequence could represent.

Profile HMMs can be constructed from a multiple sequence alignment of known family members. Each position in the alignment corresponds to a state, where states are "match", "insert" or "delete". The whole alignment can therefore be thought of as a linear chain, or path, of interconnecting states connected by transition probabilities. These states "emit" amino acid residues with different probabilities (based on the range of residues seen in the alignment together with substitution data and "pseudocount" methods - to correct for limited data in the initial alignment). The probability of a particular sequence matching the model can be calculated as a combination of the transition probabilities between states and the emission probabilities for that amino acid sequence.

Once a good alignment of known family members has been obtained, HMMs can be constructed with little manual intervention (compared with profiles) and are a more sensitive method for detecting remote homologues. The Pfam database is a library of

profile HMMs for many protein families (Bateman, A., Birney, E., Durbin, R., Eddy, S.R., Finn, R.D. and Sonhammer, E.L.L. (1999), Pfam 3.1: 1313 multiple alignments and profile HMMs match the majority of proteins, *Nucleic Acids Research*, 27: 260-262). It contains models constructed from carefully edited seed alignments and models
5 automatically generated by an iterative procedure. This complete automation of the process has the disadvantage that any errors that are made will be rapidly propagated.

POLYPEPTIDE VARIANTS AND DERIVATIVES

10 The terms "variant" or "derivative" in relation to the amino acid sequences of the present invention includes any substitution of, variation of, modification of, replacement of, deletion of or addition of one (or more) amino acids from or to the sequence providing the resultant amino acid sequence has PFI-013 activity, preferably having at least the same activity as the polypeptide presented in SEQ ID NO: 2.

15

The sequences of the present invention may be modified for use in the present invention. Typically, modifications are made that maintain the PFI-013 activity of the sequence. Amino acid substitutions may be made, for example from 1, 2 or 3 to 10, 20 or 30 substitutions provided that the modified sequence retains PFI-013 activity. Amino
20 acid substitutions may include the use of non-naturally occurring analogues, for example to increase blood plasma half-life of a therapeutically administered polypeptide.

Conservative substitutions may be made, for example according to the Table below.

25 Amino acids in the same block in the second column and preferably in the same line in the third column may be substituted for each other:

ALIPHATIC	Non-polar	G A P
		I L V
	Polar - uncharged	C S T M
		N Q
	Polar - charged	D E
		K R
AROMATIC		H F W Y

As indicated above, proteins of the invention are typically made by recombinant means, for example as described herein, and/or by using synthetic means using techniques well known to the skilled person such as solid phase synthesis. Variants and derivatives of such sequences include fusion proteins, wherein the fusion proteins comprise at least the amino acid sequence of the present invention being linked (directly or indirectly) to another amino acid sequence. These other amino acid sequences - which are sometimes referred to as fusion protein partners - will typically impart a favourable functionality - such as to aid extraction and purification of the amino acid sequence of the present invention. Examples of fusion protein partners include glutathione-S-transferase (GST), 6xHis, GAL4 (DNA binding and/or transcriptional activation domains) and β -galactosidase. It may also be convenient to include a proteolytic cleavage site between the fusion protein partner and the protein sequence of the present invention so as to allow removal of the latter. Preferably the fusion protein partner will not hinder the function of the protein of the present invention.

POLYNUCLEOTIDE VARIANTS AND DERIVATIVES

The terms "variant" or "derivative" in relation to the nucleotide sequence of the present invention include any substitution of, variation of, modification of, replacement of, deletion of or addition of one (or more) nucleic acid from or to the sequence providing the resultant nucleotide sequence codes for a polypeptide having PFI-013 activity, preferably having at least the same activity as the sequence presented in SEQ ID NO: 2.

As indicated above, with respect to sequence homology, there is at least 70%, preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least 90%, more preferably at least 95% homology to the nucleotide sequence shown in

SEQ ID NO: 1. Most preferably there is at least 98% homology to the nucleotide sequence shown in SEQ ID NO: 1. Nucleotide homology comparisons may be conducted as described above. For some applications, a preferred sequence comparison program is the GCG Wisconsin Bestfit program described above. The default scoring matrix has a
5 match value of 10 for each identical nucleotide and -9 for each mismatch. The default gap creation penalty is -50 and the default gap extension penalty is -3 for each nucleotide.

As used herein, the terms "variant", "homologue", "fragment" and "derivative" embrace allelic variations of the sequences.

10

The term "variant" also encompasses sequences that are complementary to sequences that are capable of hybridising to the nucleotide sequences presented herein.

HYBRIDISATION

15

The term "hybridisation" as used herein shall include "the process by which a strand of nucleic acid joins with a complementary strand through base pairing" (Coombs J (1994) Dictionary of Biotechnology, Stockton Press, New York, NY, USA) as well as the process of amplification as carried out in PCR technologies as described in Dieffenbach
20 CW and GS Dveksler (1995, PCR Primer, a Laboratory Manual, Cold Spring Harbor Press, Plainview, NY, USA).

Hybridisation conditions are based on the melting temperature (T_m) of the nucleic acid binding complex, as taught in Berger and Kimmel (1987, Guide to Molecular Cloning
25 Techniques, Methods in Enzymology, Vol 152, Academic Press, San Diego, CA, USA), and confer a defined "stringency" as explained below.

Stringency of hybridisation refers to conditions under which polynucleic acids hybrids are stable. Such conditions are evident to those of ordinary skill in the field. As known
30 to those of skill in the art, the stability of hybrids is reflected in the melting temperature (T_m) of the hybrid which decreases approximately 1 to 1.5°C with every 1% decrease in sequence homology. In general, the stability of a hybrid is a function of sodium ion

concentration and temperature. Typically, the hybridisation reaction is performed under conditions of higher stringency, followed by washes of varying stringency.

As used herein, high stringency refers to conditions that permit hybridisation of only those nucleic acid sequences that form stable hybrids in 1 M Na⁺ at 65-68°C.

Maximum stringency typically occurs at about T_m-5°C (5°C below the T_m of the probe).

High stringency occurs at about 5°C to 10°C below the T_m of the probe. High stringency conditions can be provided, for example, by hybridisation in an aqueous solution containing 6x SSC, 5x Denhardt's, 1% SDS (sodium dodecyl sulphate), 0.1 Na⁺ pyrophosphate and 0.1 mg/ml denatured salmon sperm DNA as non-specific competitor. Following hybridisation, high stringency washing may be done in several steps, with a final wash (about 30 min) at the hybridisation temperature in 0.2-0.1x SSC, 0.1% SDS.

Moderate, or intermediate, stringency typically occurs at about 10°C to 20°C below the T_m of the probe.

Low stringency typically occurs at about 20°C to 25°C below the T_m of the probe.

As will be understood by those of skill in the art, a maximum stringency hybridisation can be used to identify or detect identical polynucleotide sequences while an intermediate (or low) stringency hybridisation can be used to identify or detect similar or related polynucleotide sequences.

Moderate stringency refers to conditions equivalent to hybridisation in the above-described solution but at about 60-62°C. In that case the final wash is performed at the hybridisation temperature in 1x SSC, 0.1% SDS.

Low stringency refers to conditions equivalent to hybridisation in the above-described solution at about 50-52°C. In that case, the final wash is performed at the hybridisation temperature in 2x SSC, 0.1% SDS.

- 5 It is understood that these conditions may be adapted and duplicated using a variety of buffers, e.g. formamide-based buffers, and temperatures. Denhardt's solution and SSC are well known to those of skill in the art as are other suitable hybridisation buffers (see, e.g., Sambrook, *et al.*, eds. (1989) *Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratory Press, New York, NY, USA or Ausubel, *et al.*, eds. (1990) *Current Protocols in Molecular Biology*, John Wiley & Sons, Inc.). Optimal hybridisation conditions have to be determined empirically, as the length and the GC content of the probe also play a role.

- 15 Polynucleotides of the invention capable of selectively hybridising to the nucleotide sequences presented herein, or to their complement, will be generally at least 70%, preferably at least 75%, more preferably at least 80%, more preferably at least 85%, more preferably at least 90%, more preferably at least 95%, most preferably at least 98% homologous to the corresponding nucleotide sequences presented herein over a region of at least 20, preferably at least 25 or 30, for instance at least 40, 60 or 100 or more
20 contiguous nucleotides.

- The term "selectively hybridisable" means that the polynucleotide used as a probe is used under conditions where a target polynucleotide of the invention is found to hybridize to the probe at a level significantly above background. The background hybridization may
25 occur because of other polynucleotides present, for example, in the cDNA or genomic DNA library being screened. In this event, background implies a level of signal generated by interaction between the probe and a non-specific DNA member of the library which is less than 10-fold, preferably less than 100-fold as intense as the specific interaction observed with the target DNA. The intensity of interaction may be measured, for
30 example, by radiolabelling the probe, e.g. with ³²P.

In a preferred aspect, the present invention covers nucleotide sequences that can hybridise to any one or more of the nucleotide sequences of the present invention under stringent conditions (e.g. 65°C and 0.1xSSC {1xSSC = 0.15 M NaCl, 0.015 M Na₃ Citrate pH 7.0}).

5

Where the polynucleotide of the present invention is double-stranded, both strands of the duplex, either individually or in combination, are encompassed by the present invention. Where the polynucleotide is single-stranded, it is to be understood that the complementary sequence of that polynucleotide is also included within the scope of the present invention.

10

Polynucleotides which are not 100% homologous to the sequences of the present invention but fall within the scope of the invention can be obtained in a number of ways. Other variants of the sequences described herein may be obtained, for example, by probing DNA libraries made from a range of individuals, for example individuals from different populations. In addition, other viral/bacterial, or cellular homologues particularly cellular homologues found in mammalian cells (e.g. bovine, ovine, porcine, equine, rodent and primate cells), may be obtained and such homologues and fragments thereof in general will be capable of selectively hybridising to the sequence shown in SEQ ID NO:

1. Such sequences may be obtained by probing cDNA libraries made from, or genomic DNA libraries derived from, other animal species, and probing such libraries with probes comprising all or part of the sequence shown in SEQ ID NO: 1 under conditions of medium to high stringency. Similar considerations apply to obtaining species homologues and allelic variants of the polypeptide or nucleotide sequences of the invention.

25 Variants and strain/species homologues may also be obtained using degenerate PCR which will use primers designed to target sequences within the variants and homologues encoding conserved amino acid sequences within the sequences of the present invention. Conserved sequences can be predicted, for example, by aligning the amino acid sequences from several variants/homologues. Sequence alignments can be performed using computer software known in the art. For example the GCG Wisconsin PileUp or ClustalW program is widely used.

The primers used in degenerate PCR will contain one or more degenerate positions and will be used at stringency conditions lower than those used for cloning sequences with single sequence primers against known sequences.

- 5 Alternatively, such polynucleotides may be obtained by site-directed mutagenesis of characterised sequences. This may be useful where, for example, silent codon changes are required to sequences to optimise codon preferences for a particular host cell in which the polynucleotide sequences are being expressed. Other sequence changes may be desired in order to introduce restriction enzyme recognition sites, or to alter the property or function
10 of the polypeptides encoded by the polynucleotides.

Polynucleotides of the invention may be used to produce a primer, e.g. a PCR primer, a primer for an alternative amplification reaction, a probe e.g. labelled with a revealing label by conventional means using radioactive or non-radioactive labels, or the polynucleotides
15 may be cloned into vectors. Such primers, probes and other fragments will be at least 15, preferably at least 20, for example at least 25, 30 or 40 nucleotides in length, and are also encompassed by the term polynucleotides of the invention as used herein.

Polynucleotides such as DNA polynucleotides and probes according to the invention may
20 be produced recombinantly, synthetically, or by any means available to those of skill in the art. They may also be cloned by standard techniques.

In general, primers will be produced by synthetic means, involving a step wise manufacture of the desired nucleic acid sequence one nucleotide at a time. Techniques for
25 accomplishing this using automated techniques are readily available in the art.

Longer polynucleotides will generally be produced using recombinant means, for example using PCR cloning techniques. This will involve making a pair of primers (e.g. of about 15 to 30 nucleotides) flanking a region of the sequence which it is desired to clone,
30 bringing the primers into contact with mRNA or cDNA obtained from an animal or human cell, performing a polymerase chain reaction under conditions which bring about amplification of the desired region, isolating the amplified fragment (e.g. by purifying the

reaction mixture on an agarose gel) and recovering the amplified DNA. The primers may be designed to contain suitable restriction enzyme recognition sites so that the amplified DNA can be cloned into a suitable cloning vector.

5 REGULATORY SEQUENCES

Preferably, the polynucleotide of the present invention is operably linked to a regulatory sequence which is capable of providing for the expression of the coding sequence, such as by the chosen host cell. By way of example, the present invention covers a vector comprising the polynucleotide of the present invention operably linked to such a regulatory sequence, i.e. the vector is an expression vector.

The term "operably linked" refers to a juxtaposition wherein the components described are in a relationship permitting them to function in their intended manner. A regulatory sequence "operably linked" to a coding sequence is ligated in such a way that expression of the coding sequence is achieved under condition compatible with the control sequences.

The term "regulatory sequences" includes promoters and enhancers and other expression regulation signals.

The term "promoter" is used in the normal sense of the art, e.g. an RNA polymerase binding site.

Enhanced expression of the polynucleotide encoding the polypeptide of the present invention may also be achieved by the selection of heterologous regulatory regions, e.g. promoter, secretion leader and terminator regions, which serve to increase expression and, if desired, secretion levels of the protein of interest from the chosen expression host and/or to provide for the inducible control of the expression of the polypeptide of the present invention.

Preferably, the nucleotide sequence of the present invention may be operably linked to at least a promoter.

Aside from the promoter native to the gene encoding the polypeptide of the present invention, other promoters may be used to direct expression of the polypeptide of the present invention. The promoter may be selected for its efficiency in directing the expression of the polypeptide of the present invention in the desired expression host.

In another embodiment, a constitutive promoter may be selected to direct the expression of the desired polypeptide of the present invention. Such an expression construct may provide additional advantages since it circumvents the need to culture the expression hosts on a medium containing an inducing substrate.

Examples of suitable promoters would be LTR, SV40 and CMV in mammalian systems; *E. coli lac* or *trp* in bacterial systems; baculovirus polyhedron promoter (*polh*) in insect systems and other promoters that are known to control expression in eukaryotic and prokaryotic cells or their viruses.

Examples of strong constitutive and/or inducible promoters which are preferred for use in fungal expression hosts are those which are obtainable from the fungal genes for xylanase (*xlnA*), phytase, ATP-synthetase, subunit 9 (*oliC*), triose phosphate isomerase (*tpi*), alcohol dehydrogenase (*AdhA*), α -amylase (*amy*), amyloglucosidase (AG - from the *glaA* gene), acetamidase (*amdS*) and glyceraldehyde-3-phosphate dehydrogenase (*gpd*) promoters.

Examples of strong yeast promoters are those obtainable from the genes for alcohol dehydrogenase, lactase, 3-phosphoglycerate kinase and triosephosphate isomerase.

Examples of strong bacterial promoters are the α -amylase and *SP02* promoters as well as promoters from extracellular protease genes.

Hybrid promoters may also be used to improve inducible regulation of the expression construct.

- 5 The promoter can additionally include features to ensure or to increase expression in a suitable host. For example, the features can be conserved regions such as a Pribnow Box or a TATA box. The promoter may even contain other sequences to affect (such as to maintain, enhance or decrease) the levels of expression of the nucleotide sequence of the present invention. For example, suitable other sequences include the Sh1-intron or an ADH intron. Other sequences include inducible elements - such as temperature, chemical, 10 light or stress inducible elements. Also, suitable elements to enhance transcription or translation may be present. An example of the latter element is the TMV 5' signal sequence (see Sleat, Gene 217 [1987] 217-225; and Dawson, Plant Mol. Biol. 23 [1993] 97).
- 15 The expression vector may also contain sequences which act on the promoter to amplify expression. For example, the SV40, CMV, and polyoma cis-acting elements (enhancer) and a selectable marker can provide a phenotypic trait for selection (e.g. dihydrofolate reductase or neomycin resistance for mammalian cells or ampicillin/tetracyclin resistance for *E. coli*). Selection of the appropriate vector containing the appropriate 20 promoter and selection marker is well within the level of those skilled in the art.

CONSTRUCTS

- 25 The term "construct" - which is synonymous with terms such as "conjugate", "cassette" and "hybrid" - includes the nucleotide sequence according to the present invention directly or indirectly attached to a promoter. An example of an indirect attachment is the provision of a suitable spacer group such as an intron sequence, such as the Sh1-intron or the ADH intron, intermediate the promoter and the nucleotide sequence of the present invention. The same is true for the term "fused" in relation to the present invention which includes 30 direct or indirect attachment. In each case, the terms do not cover the natural combination of the nucleotide sequence coding for the protein ordinarily associated with the wild-type gene promoter and when they are both in their natural environment.

The construct may even contain or express a marker which allows for the selection of the genetic construct in, for example, mammalian, yeast, insect, fungal or bacterial cells. Various markers exist which may be used, such as, for example, those that provide for
5 antibiotic resistance to G418, hygromycin, bleomycin, kanamycin and gentamycin.

Preferably the construct of the present invention comprises at least the nucleotide sequence of the present invention operably linked to a promoter.

10 VECTORS

The term "vector" includes expression vectors and transformation vectors and shuttle vectors.

15 The term "expression vector" means a construct capable of *in vivo* or *in vitro* expression.

The term "transformation vector" means a construct capable of being transferred from one entity to another entity - which may be of the same species or may be of a different species. If the construct is capable of being transferred from one species to another - such
20 as from a viral vector such as MMLV or FIV to a human or mammalian primary cell or cell line, then the transformation vector is sometimes referred to as a "shuttle vector".

A large variety of expression systems may be used in different hosts. For example, episomal, chromosomal and virus-derived systems (e.g. vectors derived from bacterial
25 plasmids, bacteriophage, papova virus such as SV40, vaccinia virus, adenovirus, and retrovirus).

The DNA sequence can be inserted into the vector by a variety of techniques. In general the DNA sequence is inserted into an appropriate restriction endonuclease site by
30 procedures known in the art and deemed to be within the scope of those skilled in the art. The DNA sequence in the expression vector is linked operatively to appropriate control sequences that direct mRNA synthesis (i.e the promoter).

The vectors of the present invention may be transformed into a suitable host cell as described below to provide for expression of a polypeptide of the present invention. Thus, in a further aspect, the invention provides a process for preparing polypeptides according to the present invention which comprises cultivating a host cell transformed or transfected with an expression vector as described above under conditions to provide for expression by the vector of a coding sequence encoding the polypeptides, and recovering the expressed polypeptides.

- 10 The vectors may be, for example, plasmid, virus or bacteriophage (phage) vectors provided with an origin of replication, optionally a promoter for the expression of the polynucleotide and optionally a regulator of the promoter.

- The vectors of the present invention may contain one or more selectable marker genes.
- 15 The most suitable selection systems for industrial micro-organisms are those formed by the group of selection markers which do not require a mutation in the host organism. Examples of fungal selection markers are the genes for acetamidase (*amdS*), ATP synthetase, subunit 9 (*oliC*), orotidine-5'-phosphate-decarboxylase (*pvrA*), phleomycin and benomyl resistance (*benA*). Examples of non-fungal selection markers are the
- 20 bacterial G418 resistance gene (this may also be used in mammalian cells, yeast, but not in filamentous fungi), the ampicillin resistance gene (*E. coli*), the neomycin resistance gene (mammalian cells) and the *E. coli uidA* gene, coding for β -glucuronidase (GUS).

- Vectors may be used *in vitro*, for example for the production of RNA or used to
- 25 transfect or transform a host cell.

- Thus, polynucleotides of the present invention can be incorporated into a recombinant vector (typically a replicable vector), for example a cloning or expression vector. The vector may be used to replicate the nucleic acid in a compatible host cell. Thus, in a
- 30 further embodiment, the invention provides a method of making polynucleotides of the present invention by introducing a polynucleotide of the present invention into a replicable vector, introducing the vector into a compatible host cell, and growing the

host cell under conditions which bring about replication of the vector. The vector may be recovered from the host cell. Suitable host cells are described below in connection with expression vectors.

5 The present invention also relates to the use of genetically engineered host cells expressing a PFI-013 polypeptide or variant, homologue, fragment, analogue or derivative thereof in screening methods for the identification of modulators (e.g. antagonists or agonists) of PFI-013. Such genetically engineered host cells could be used to screen peptide libraries or organic molecules capable of modulating PFI-013
10 activity. Modulators (e.g. antagonists) of the PFI-013 polypeptide, such as antibodies, peptides or small organic molecules will provide the basis for pharmaceutical compositions for the treatment of diseases associated with, for example, PFI-013. Such modulators (e.g. antagonists) can be administered alone or in combination with other therapeutics for the treatment of such diseases.

15 The present invention also relates to expression vectors and host cells comprising polynucleotide sequences encoding PFI-013 or a variant, homologue, fragment, analogue or derivative thereof for the *in vivo* or *in vitro* production of PFI-013 protein or to screen for agents that can affect PFI-013 expression or activity.

20

TISSUE

The term "tissue" as used herein includes tissue *per se* and organ.

25 HOST CELLS

The term "host cell" - in relation to the present invention - includes any cell that could comprise the nucleotide sequence coding for the recombinant protein according to the present invention and/or products obtained therefrom, wherein a promoter can allow
30 expression of the nucleotide sequence according to the present invention when present in the host cell.

Thus, a further embodiment of the present invention provides host cells transformed or transfected with a polynucleotide of the present invention. Preferably said polynucleotide is carried in a vector for the replication and expression of said polynucleotide. The cells will be chosen to be compatible with the said vector and may, 5 for example, be prokaryotic (for example, bacterial cells), or eukaryotic (i.e. mammalian, fungal, insect and yeast cells).

Introduction of polynucleotides into host cells can be effected by methods as described in Sambrook, *et al.*, eds. (1989) Molecular Cloning: A Laboratory Manual, Cold Spring 10 Harbor Laboratory Press, New York, NY, USA. These methods include, but are not limited to, calcium phosphate transfection, DEAE-dextran-mediated transfection, cationic lipid-mediated transfection, electroporation, transvection, microinjection, transduction, scrape loading, and ballistic introduction.

15 Examples of representative hosts include, bacterial cells (e.g. *E. coli*, *Streptomyces*); fungal cells such as yeast cells and *Aspergillus*; insect cells such as *Drosophila* S2 and *Spodoptera* SF9 cells; animal cells such as CHO, COS, HEK, HeLa, and 3T3 cells. The selection of the appropriate host is deemed to be within the scope of those skilled in the art.

20 Depending on the nature of the polynucleotide encoding the polypeptide of the present invention, and/or the desirability for further processing of the expressed protein, eukaryotic hosts such as yeasts or other fungi may be preferred. In general, yeast cells are preferred over fungal cells because they are easier to manipulate. However, some 25 proteins are either poorly expressed or secreted from the yeast cell, or in some cases are not processed properly (e.g. hyperglycosylation in yeast). In these instances, a different fungal host organism should be selected.

Examples of suitable expression hosts within the scope of the present invention are 30 fungi such as *Aspergillus* species (such as those described in EP-A-0184438 and EP-A-0284603) and *Trichoderma* species; bacteria such as *Escherichia* species, *Streptomyces* species and *Pseudomonas* species; and yeasts such as *Kluyveromyces* species (such as

those described in EP-A-0096430 and EP-A-0301670) and *Saccharomyces* species. By way of example, typical expression hosts may be selected from *Aspergillus niger*, *Aspergillus niger* var. *tubigenis*, *Aspergillus niger* var. *awamori*, *Aspergillus aculeatis*, *Aspergillus nidulans*, *Aspergillus oryzae*, *Trichoderma reesei*, *Kluyveromyces lactis*,
5 *Schizosaccharomyces pombe*, *Pichia pastoris* and *Saccharomyces cerevisiae*.

The use of suitable host cells - such as mammalian, yeast, insect and fungal host cells - may provide for post-translational modifications (e.g. myristoylation, glycosylation, truncation, lipidation and tyrosine, serine or threonine phosphorylation) as may be
10 needed to confer optimal biological activity on recombinant expression products of the present invention.

ORGANISM

15 The term "organism" in relation to the present invention includes any organism, except man, that could comprise the nucleotide sequence coding for the recombinant protein according to the present invention and/or products obtained therefrom, wherein a promoter can allow expression of the nucleotide sequence according to the present invention when present in the organism. Examples of organisms may include a fungus, yeast or
20 protozoan.

The term "transgenic organism" in relation to the present invention includes any organism, except man, that comprises the nucleotide sequence coding for the protein according to the present invention and/or products obtained therefrom, wherein the promoter can allow
25 expression of the nucleotide sequence according to the present invention within the organism. Preferably the nucleotide sequence is incorporated in the genome of the organism.

The term "transgenic organism" does not cover the native nucleotide coding sequence
30 according to the present invention in its natural environment when it is under the control of its native promoter which is also in its natural environment. In addition, the present invention does not cover the native protein according to the present invention when it is in

its natural environment and when it has been expressed by its native nucleotide coding sequence which is also in its natural environment and when that nucleotide sequence is under the control of its native promoter which is also in its natural environment.

- 5 Therefore, the transgenic organism of the present invention includes an organism comprising any one of, or combinations of, the nucleotide sequence coding for the amino acid sequence according to the present invention, constructs according to the present invention (including combinations thereof), vectors according to the present invention, plasmids according to the present invention, cells according to the present invention, and
10 tissues according to the present invention or the products thereof. The transformed cell or organism could prepare acceptable quantities of the desired compound which would be easily retrievable from the cell or organism.

TRANSFORMATION OF HOST CELLS/HOST ORGANISMS

15

- As indicated earlier, the host organism can be a prokaryotic or a eukaryotic organism. An example of a suitable prokaryotic host is *E. coli*. Teachings on the transformation of prokaryotic hosts are well documented in the art, for example see Sambrook *et al.* (Molecular Cloning: A Laboratory Manual, 2nd edition, 1989, Cold Spring Harbor
20 Laboratory Press, New York, NY, USA) and Ausubel *et al.* (Current Protocols in Molecular Biology (1995), John Wiley & Sons, Inc.).

- In a preferred embodiment, the transformed host is a mammalian cell or, for example, an insect cell, wherein introduction of polynucleotides into said host cells can be
25 effected by methods as described in, for example, Sambrook *et al.* (Molecular Cloning: A Laboratory Manual, 2nd edition, 1989, Cold Spring Harbor Laboratory Press, New York, NY, USA). These methods include, but are not limited to, calcium phosphate transfection, DEAE-dextran-mediated transfection, cationic lipid-mediated transfection, electroporation, transvection, microinjection, transduction, scrape loading, and ballistic
30 introduction.

- In another embodiment the transgenic organism can be a yeast. In this regard, yeast have also been widely used as a vehicle for heterologous gene expression. The species *Saccharomyces cerevisiae* has a long history of industrial use, including its use for heterologous gene expression. Expression of heterologous genes in *Saccharomyces*
- 5 *cerevisiae* has been reviewed by Goodey *et al.* (1987, Yeast Biotechnology, D R Berry *et al.*, eds, pp 401-429, Allen and Unwin, London) and by King *et al.* (1989, Molecular and Cell Biology of Yeasts, E F Walton and G T Yarronton, eds, pp 107-133, Blackie, Glasgow).
- 10 For several reasons *Saccharomyces cerevisiae* is well suited for heterologous gene expression. First, it is non-pathogenic to humans and it is incapable of producing certain endotoxins. Second, it has a long history of safe use following centuries of commercial exploitation for various purposes. This has led to wide public acceptability. Third, the
- 15 extensive commercial use and research devoted to the organism has resulted in a wealth of knowledge about the genetics and physiology as well as large-scale fermentation characteristics of *Saccharomyces cerevisiae*.

- A review of the principles of heterologous gene expression in *Saccharomyces cerevisiae* and secretion of gene products is given by E Hinchcliffe and E Kenny ("Yeast as a vehicle
- 20 for the expression of heterologous genes", 1993, Yeasts, Vol 5, Anthony H Rose and J Stuart Harrison, eds, 2nd edition, Academic Press Ltd.).

- Several types of yeast vectors are available, including integrative vectors, which require recombination with the host genome for their maintenance, and autonomously replicating
- 25 plasmid vectors.

- In order to prepare the transgenic *Saccharomyces*, expression constructs are prepared by inserting the nucleotide sequence of the present invention into a construct designed for expression in yeast. Several types of constructs used for heterologous expression have
- 30 been developed. The constructs contain a promoter active in yeast fused to the nucleotide sequence of the present invention, usually a promoter of yeast origin, such as the GAL1 promoter, is used. Usually a signal sequence of yeast origin, such as the sequence

encoding the SUC2 signal peptide, is used. A terminator active in yeast ends the expression system.

- For the transformation of yeast several transformation protocols have been developed. For example, a transgenic *Saccharomyces* according to the present invention can be prepared by following the teachings of Hinnen *et al.* (1978, Proceedings of the National Academy of Sciences of the USA, 75: 1929); Beggs, J D (1978, Nature, London, 275:104); and Ito, H *et al.* (1983, J. Bacteriology 153:163-168).
- 10 The transformed yeast cells are selected using various selective markers. Among the markers used for transformation are a number of auxotrophic markers such as LEU2, HIS4 and TRP1, and dominant antibiotic resistance markers such as aminoglycoside antibiotic markers, e.g. G418.
- 15 Thus, the present invention also provides a method of transforming a host cell with a nucleotide sequence shown in SEQ ID NO: 1 or a derivative, homologue, variant, analogue or fragment thereof.

- Host cells transformed with a PFI-013 nucleotide coding sequence may be cultured under conditions suitable for the expression and recovery of the encoded protein (in cell membranes) from cell culture. The protein produced by a recombinant cell may be expressed on the cell surface, secreted or may be contained intracellularly depending on the sequence and/or the vector used. As will be understood by those of skill in the art, expression vectors containing PFI-013 coding sequences will generally enable
- 20 expression in the cell membrane. Other recombinant constructions may join PFI-013 coding sequence to nucleotide sequence encoding a polypeptide domain which will facilitate protein purification/identification (Kroll DJ *et al.* (1993) DNA Cell Biol Vol 12 p441-53, see also above discussion of vectors containing fusion proteins).

GENETICALLY ENGINEERED or GENETICALLY MODIFIED

A cell, preferably an animal cell, that is "genetically modified" is heterozygous or homozygous for a modification that is introduced into the cell, or into a progenitor cell, by genetic engineering. The standard methods of genetic engineering that are available for introducing the modification include homologous recombination, viral vector gene trapping, irradiation, chemical mutagenesis, and the transgenic expression of a nucleotide sequence encoding antisense RNA alone or in combination with catalytic ribozymes. Preferred methods for genetic modification are homologous recombination and viral vector gene trapping which both modify an endogenous gene by inserting a foreign nucleic acid sequence into the gene locus. A nucleic acid sequence that is foreign to the gene is an exogenous sequence that is non-naturally occurring in the gene. This insertion of foreign DNA can occur within any region of the PFI-013 gene, e.g., in an enhancer, promoter, regulator region, non-coding region, coding region, intron, or exon. The most preferred method of genetic engineering is homologous recombination, in which the foreign nucleic acid sequence is inserted in a targeted manner either alone or in combination with a deletion of a portion of the endogenous gene sequence.

FUNCTIONALLY DISRUPTED

By a PFI-013 gene that is "functionally disrupted" is meant a PFI-013 gene that is genetically modified such that the cellular activity of the PFI-013 polypeptide encoded by the disrupted gene is decreased in cells that normally express the wild-type version of the PFI-013 gene. When the genetic modification effectively eliminates all wild-type copies of the PFI-013 gene in a cell (e.g., the genetically modified cell, preferably an animal cell, is homozygous for the PFI-013 gene disruption or the only wild-type copy of PFI-013 gene originally present is now disrupted), then the genetic modification results in a reduction in PFI-013 polypeptide activity (i.e. reduced receptor expression) as compared to an appropriate control cell that expresses the wild-type PFI-013 gene. This reduction in PFI-013 polypeptide activity (i.e. reduced receptor expression) results from either reduced PFI-013 gene expression (i.e., PFI-013 mRNA levels are effectively reduced and produce reduced levels of PFI-013 polypeptide) and/or because the

disrupted PFI-013 gene encodes a mutated polypeptide with reduced function or stability as compared to a wild-type PFI-013 polypeptide. Preferably, the activity (i.e. reduced receptor expression) of PFI-013 polypeptide in the genetically modified cell is reduced to 50% or less of wild-type levels, more preferably, to 25% or less, and, even more preferably, to 10% or less of wild-type levels. Most preferably, the PFI-013 gene disruption results in a null mutation.

GENETICALLY MODIFIED ANIMAL CELL

10 By a "genetically modified animal cell" containing a functionally disrupted PFI-013 gene is meant an animal cell, including a human cell, created by genetic engineering to contain a functionally disrupted PFI-013 gene, as well as daughter cells that inherit the disrupted PFI-013 gene. These cells may be genetically modified in culture according to any standard method known in the art. As an alternative to genetically modifying the cells in culture, non-human mammalian cells may also be isolated from a genetically modified, non-human mammal that contains a PFI-013 gene disruption. The animal cells of the invention may be obtained from primary cell or tissue preparations as well as culture-adapted, tumorigenic, or transformed cell lines. These cells and cell lines are derived, for example, from endothelial cells, epithelial cells, islets, neurons and other neural tissue-derived cells, mesothelial cells, osteocytes, lymphocytes, chondrocytes, hematopoietic cells, immune cells, cells of the major glands or organs (e.g., liver, lung, heart, stomach, pancreas, kidney, and skin), muscle cells (including cells from skeletal muscle, smooth muscle, and cardiac muscle), exocrine or endocrine cells, fibroblasts, and embryonic and other totipotent or pluripotent stem cells (e.g., embryonic stem (ES) cells, ES-like cells, and embryonic germline (EG) cells, and other stem cells, such as progenitor cells and tissue-derived stem cells). The preferred genetically modified cells are ES cells, more preferably, mouse or rat ES cells, and, most preferably, human ES cells.

30 A "homology region" used in a targeting vector for homologous recombination with a PFI-013 gene is related (i.e., complementary) to a portion of the PFI-013 gene or a sequence flanking the PFI-013 gene to a degree sufficient to allow hybridization to

occur between the homology region and the PFI-013 gene sequence under standard low stringency conditions known in the art (e.g., as described in Current Protocols in Human Genetics, unit 4.1, John Wiley & Sons, New York, NY, 2000).

- 5 By an "ES cell" or an "ES-like cell" is meant a pluripotent stem cell derived from an embryo, from a primordial germ cell, or from a teratocarcinoma, that is capable of indefinite self renewal as well as differentiation into cell types that are representative of all three embryonic germ layers.
- 10 By "reduced" is meant a statistically significant decrease (i.e., $p < 0.1$).

The genetically modified animal cells, including human cells, of the invention are heterozygous or homozygous for a modification that functionally disrupts the PFI-013 gene. The animal cells may be derived by genetically engineering cells in culture, or, in
15 the case of non-human mammalian cells, the cells may be isolated from genetically modified, non-human mammals.

The PFI-013 gene locus is functionally disrupted by one of the several techniques for genetic modification known in the art, including chemical mutagenesis (Rinchik, Trends
20 in Genetics 7: 15-21, 1991, Russell, Environmental & Molecular Mutagenesis 23 (Suppl. 24) 23-29, 1994), irradiation (Russell, *supra*), transgenic expression of PFI-013 gene antisense RNA, either alone or in combination with a catalytic RNA ribozyme sequence (Luyckx *et al.*, Proc. Natl. Acad. Sci. 96: 12174-79, 1999; Sokol *et al.*, Transgenic Research 5: 363-71, 1996; Efrat *et al.*, Proc. Natl. Acad. Sci. USA 91: 2051-
25 55, 1994; Larsson *et al.*, Nucleic Acids Research 22: 2242-48, 1994) and, as further discussed below, the disruption of the PFI-013 gene by the insertion of a foreign nucleic acid sequence into the PFI-013 gene locus. Preferably, the foreign sequence is inserted by homologous recombination or by the insertion of a viral vector. Most preferably, the method of PFI-013 gene disruption is homologous recombination and includes a
30 deletion of a portion of the endogenous PFI-013 gene sequence.

The integration of the foreign sequence functionally disrupts the PFI-013 gene through one or more of the following mechanisms: by interfering with the PFI-013 gene transcription or translation process (e.g., by interfering with promoter recognition, or by introducing a transcription termination site or a translational stop codon into the PFI-013 gene); or by distorting the PFI-013 gene coding sequence such that it no longer encodes a PFI-013 polypeptide with normal receptor function (e.g., by inserting a foreign coding sequence into the PFI-013 gene coding sequence, by introducing a frameshift mutation or amino acid(s) substitution, or, in the case of a double crossover event, by deleting a portion of the PFI-013 gene coding sequence that is required for expression of a functional receptor protein).

To insert a foreign sequence into a PFI-013 gene locus in the genome of a cell, the foreign DNA sequence is introduced into the cell according to a standard method known in the art such as electroporation, calcium-phosphate precipitation, retroviral infection, microinjection, biolistics, liposome transfection, DEAE-dextran transfection, or transferrinfection (see, e.g., Neumann *et al.*, EMBO J. 1: 841-845, 1982; Potter *et al.*, Proc. Natl. Acad. Sci USA 81: 7161-65, 1984; Chu *et al.*, Nucleic Acids Res. 15: 1311-26, 1987; Thomas and Capecchi, Cell 51: 503-12, 1987; Baum *et al.*, Biotechniques 17: 1058-62, 1994; Biewenga *et al.*, J. Neuroscience Methods 71: 67-75, 1997; Zhang *et al.*, Biotechniques 15: 868-72, 1993; Ray and Gage, Biotechniques 13: 598-603, 1992; Lo, Mol. Cell. Biol. 3: 1803-14, 1983; Nickoloff *et al.*, Mol. Biotech. 10: 93-101, 1998; Linney *et al.*, Dev. Biol. (Orlando) 213: 207-16, 1999; Zimmer and Gruss, Nature 338: 150-153, 1989; and Robertson *et al.*, Nature 323: 445-48, 1986). The preferred method for introducing foreign DNA into a cell is electroporation.

Homologous recombination

The method of homologous recombination targets the PFI-013 gene for disruption by introducing a PFI-013 gene targeting vector into a cell containing a PFI-013 gene. The ability of the vector to target the PFI-013 gene for disruption stems from using a nucleotide sequence in the vector that is homologous to the PFI-013 gene. This homology region facilitates hybridization between the vector and the endogenous

sequence of the PFI-013 gene. Upon hybridization, the probability of a crossover event between the targeting vector and genomic sequences greatly increases. This crossover event results in the integration of the vector sequence into the PFI-013 gene locus and the functional disruption of the PFI-013 gene.

5

General principles regarding the construction of vectors used for targeting are reviewed in Bradley *et al.* (Biotechnol. 10: 534, 1992). Two different exemplary types of vector can be used to insert DNA by homologous recombination: an insertion vector or a replacement vector. An insertion vector is circular DNA which contains a region of PFI-013 gene homology with a double stranded break. Following hybridization between the homology region and the endogenous PFI-013 gene, a single crossover event at the double stranded break results in the insertion of the entire vector sequence into the endogenous gene at the site of crossover.

15 The more preferred vector to use for homologous recombination is a replacement vector, which is colinear rather than circular. Replacement vector integration into the PFI-013 gene requires a double crossover event, i.e. crossing over at two sites of hybridization between the targeting vector and the PFI-013 gene. This double crossover event results in the integration of vector sequence that is sandwiched between the two sites of crossover into the PFI-013 gene and the deletion of the corresponding endogenous PFI-013 gene sequence that originally spanned between the two sites of crossover (see, e.g., Thomas and Capecchi *et al.*, Cell 51: 503-12, 1987; Mansour *et al.*, Nature 336: 348-52, 1988; Mansour *et al.*, Proc. Natl. Acad. Sci. USA 87: 7688-7692, 1990; and Mansour, GATA 7: 219-227, 1990).

25

A region of homology in a targeting vector is generally at least 100 nucleotides in length. Most preferably, the homology region is at least 1-5 kilobases (Kb) in length. Although there is no demonstrated minimum length or minimum degree of relatedness required for a homology region, targeting efficiency for homologous recombination generally corresponds with the length and the degree of relatedness between the targeting vector and the PFI-013 gene locus. In the case where a replacement vector is used, and a portion of the endogenous PFI-013 gene is deleted upon homologous

30

- recombination, an additional consideration is the size of the deleted portion of the endogenous PFI-013 gene. If this portion of the endogenous PFI-013 gene is greater than 1 Kb in length, then a targeting cassette with regions of homology that are longer than 1 Kb is recommended to enhance the efficiency of recombination. Further guidance regarding the selection and use of sequences effective for homologous recombination is described in the literature (see, e.g., Deng and Capecchi, *Mol. Cell. Biol.* 12: 3365-3371, 1992; Bollag *et al.*, *Annu. Rev. Genet.* 23: 199-225, 1989; and Waldman and Liskay, *Mol. Cell. Biol.* 8: 5350-5357, 1988).
- 10 A wide variety of cloning vectors may be used as vector backbones in the construction of PFI-013 gene targeting vectors, including pBluescript-related plasmids (e.g., Bluescript KS+11), pQE70, pQE60, pQE-9, pBS, pD10, phagescript, phiX174, pBK Phagemid, pNH8A, pNH16a, pNH18Z, pNH46A, ptrc99a, pKK223-3, pKK233-3, pDR540, and pRIT5 PWLNEO, pSV2CAT, pXT1, pSG (Stratagene), pSVK3, PBPV, 15 PMSG, and pSVL, pBR322 and pBR322-based vectors, pBM9, pBR325, pKH47, pBR328, pHC79, phage Charon 28, pKB11, pKSV-10, pK19 related plasmids, pUC plasmids, and the pGEM series of plasmids. These vectors are available from a variety of commercial sources (e.g., Boehringer Mannheim Biochemicals, Indianapolis, IN; Qiagen, Valencia, CA; Stratagene, La Jolla, CA; Promega, Madison, WI; and New 20 England Biolabs, Beverly, MA). However, any other vectors, e.g. plasmids, viruses, or parts thereof, may be used as long as they are replicable and viable in the desired host. The vector may also comprise sequences which enable it to replicate in the host whose genome is to be modified. The use of such a vector can expand the interaction period during which recombination can occur, increasing the efficiency of targeting (see 25 *Molecular Biology*, ed. Ausubel *et al.*, Unit 9.16, Fig. 9.16.1).

The specific host employed for propagating the targeting vectors described above is not critical. Examples include *E. coli* K12 RR1 (Bolivar *et al.*, *Gene* 2: 95, 1977), *E. coli* K12 HB101 (ATCC No. 33694), *E. coli* MM21 (ATCC No. 336780), *E. coli* DH1 30 (ATCC No. 33849), *E. coli* strain DH5 α , and *E. coli* STBL2. Alternatively, hosts such as *Saccharomyces cerevisiae* can be used. The above-mentioned hosts are available commercially (e.g., Stratagene, La Jolla, CA; and Life Technologies, Rockville, MD).

To create the targeting vector, a PFI-013 gene targeting construct is added to an above-described vector backbone. The PFI-013 gene targeting constructs described above have at least one PFI-013 gene homology region. To make the PFI-013 gene homology regions, a PFI-013 gene-related sequence is used as a basis for producing polymerase chain reaction (PCR) primers. These primers are used to amplify the desired region of the PFI-013 sequence by high fidelity PCR amplification (Mattila *et al.*, Nucleic Acids Res. 19: 4967, 1991; Eckert and Kunkel 1: 17, 1991; and U.S. Pat. No. 4,683,202). The genomic sequence is obtained from a genomic clone library or from a preparation of genomic DNA, preferably from the animal species that is to be targeted for PFI-013 gene disruption.

Preferably, the targeting constructs described above also include an exogenous nucleotide sequence encoding a positive marker protein. The stable expression of a positive marker after vector integration confers an identifiable characteristic on the cell without compromising cell viability. Therefore, in the case of a replacement vector, the marker gene is positioned between two flanking homology regions so that it integrates into the PFI-013 gene following the double crossover event.

It is preferred that the positive marker protein is a selectable protein; the stable expression of such a protein in a cell confers a selectable phenotypic characteristic, i.e., the characteristic enhances the survival of the cell under otherwise lethal conditions. Thus, by imposing the selectable condition, one can isolate cells that stably express the positive selectable marker from other cells that have not successfully integrated the vector sequence on the basis of viability. Examples of positive selectable marker proteins (and their agents of selection) include Neo (G418 or kanamycin), Hyg (hygromycin), HisD (histidinol), Gpt (xanthine), Ble (bleomycin), and Hprr (hypoxanthine) (see, e.g., Capecchi and Thomas, U.S. Pat. No. 5,464,764, and Capecchi, Science 244: 1288-92, 1989). Other positive markers that may also be used as an alternative to a selectable marker include reporter proteins such as β -galactosidase, firefly luciferase, or green fluorescent protein (see, e.g., Current Protocols in Cytometry,

Unit 9.5, and Current Protocols in Molecular Biology, Unit 9.6, John Wiley & Sons, New York, NY, 2000).

The above-described positive selection scheme does not distinguish between cells that
5 have integrated the vector by targeted homologous recombination at the PFI-013 gene
locus versus random, non-homologous integration of vector sequence into any
chromosomal position. Therefore, when using a replacement vector for homologous
recombination, it is also preferred to include a nucleotide sequence encoding a negative
selectable marker protein. Expression of a negative selectable marker causes a cell
10 expressing the marker to lose viability when exposed to a certain agent (i.e., the marker
protein becomes lethal to the cell under certain selectable conditions). Examples of
negative selectable markers (and their agents of lethality) include herpes simplex virus
thymidine kinase (gancyclovir or 1,2-deoxy-2-fluoro- α -d-arabinofuransyl-5-iodouracil),
Hprt (6-thioguanine or 6-thioxanthine), and diphtheria toxin, ricin toxin, and cytosine
15 deaminase (5-fluorocytosine).

The nucleotide sequence encoding the negative selectable marker is positioned outside
of the two homology regions of the replacement vector. Given this positioning, cells
will only integrate and stably express the negative selectable marker if integration
20 occurs by random, non-homologous recombination; homologous recombination
between the PFI-013 gene and the two regions of homology in the targeting construct
excludes the sequence encoding the negative selectable marker from integration. Thus,
by imposing the negative condition, cells that have integrated the targeting vector by
random, non-homologous recombination lose viability.

25

The above-described combination of positive and negative selectable markers is
preferred because a series of positive and negative selection steps can be designed to
more efficiently select only those cells that have undergone vector integration by
homologous recombination, and, therefore, have a potentially disrupted PFI-013 gene.
30 Further examples of positive-negative selection schemes, selectable markers, and
targeting constructs are described, for example, in U.S. Pat. No. 5,464,764, WO
94/06908, and Valancius and Smithies, Mol. Cell. Biol. 11: 1402, 1991.

In order for a marker protein to be stably expressed upon vector integration, the targeting vector may be designed so that the marker coding sequence is operably linked to the endogenous PFI-013 gene promoter upon vector integration. Expression of the marker is then driven by the PFI-013 gene promoter in cells that normally express PFI-013 gene. Alternatively, each marker in the targeting construct of the vector may contain its own promoter that drives expression independent of the PFI-013 gene promoter. This latter scheme has the advantage of allowing for expression of markers in cells that do not typically express the PFI-013 gene (Smith and Berg, Cold Spring Harbor Symp. Quant. Biol. 49: 171, 1984; Sedivy and Sharp, Proc. Natl. Acad. Sci. (USA) 86: 227, 1989; Thomas and Capecchi, Cell 51: 503, 1987).

Exogenous promoters that can be used to drive marker gene expression include cell-specific or stage-specific promoters, constitutive promoters, and inducible or regulatable promoters. Non-limiting examples of these promoters include the herpes simplex thymidine kinase promoter, cytomegalovirus (CMV) promoter/enhancer, SV40 promoters, PGK promoter, PMCl-neo, metallothionein promoter, adenovirus late promoter, vaccinia virus 7.5K promoter, avian beta globin promoter, histone promoters (e.g., mouse histone H3-614), beta actin promoter, neuron-specific enolase, muscle actin promoter, and the cauliflower mosaic virus 35S promoter (see generally, Sambrook *et al.*, *Molecular Cloning*, Vols. I-III, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1989, and *Current Protocols in Molecular Biology*, John Wiley & Sons, New York, NY, 2000; Stratagene, La Jolla, CA).

To confirm whether cells have integrated the vector sequence into the targeted PFI-013 gene locus, primers or genomic probes that are specific for the desired vector integration event can be used in combination with PCR or Southern blot analysis to identify the presence of the desired vector integration into the PFI-013 gene locus (Erllich *et al.*, Science 252: 1643-51, 1991; Zimmer and Gruss, Nature 338: 150, 1989; Mouellic *et al.*, Proc. Natl. Acad. Sci. (USA) 87: 4712, 1990; and Shesely *et al.*, Proc. Natl. Acad. Sci. (USA) 88: 4294, 1991).

Gene trapping

Another method available for inserting a foreign nucleic acid sequence into the PFI-013 gene locus to functionally disrupt the PFI-013 gene is gene trapping. This method takes advantage of the cellular machinery present in all mammalian cells that splices exons into mRNA to insert a gene trap vector coding sequence into a gene in a random fashion. Once inserted, the gene trap vector creates a mutation that may functionally disrupt the trapped PFI-013 gene. In contrast to homologous recombination, this system for mutagenesis creates largely random mutations. Thus, to obtain a genetically modified cell that contains a functionally disrupted PFI-013 gene, cells containing this particular mutation must be identified and selected from a pool of cells that contain random mutations in a variety of genes.

Gene trapping systems and vectors have been described for use in genetically modifying murine cells and other cell types (see, e.g., Allen *et al.*, *Nature* 333: 852-55, 1988; Bellen *et al.*, *Genes Dev.* 3: 1288-1300, 1989; Bier *et al.*, *Genes Dev.* 3: 1273-1287, 1989; Bonnerot *et al.*, *J. Virol.* 66: 4982-91, 1992; Brenner *et al.*, *Proc. Nat. Acad. Sci. USA* 86: 5517-21, 1989; Chang *et al.*, *Virology* 193: 737-47, 1993; Friedrich and Soriano, *Methods Enzymol.* 225: 681-701, 1993; Friedrich and Soriano, *Genes Dev.* 5: 1513-23, 1991; Goff, *Methods Enzymol.* 152: 469-81, 1987; Gossler *et al.*, *Science* 244: 463-65, 1989; Hope, *Develop.* 113: 399-408, 1991; Kerr *et al.*, *Cold Spring Harb. Symp. Quant. Biol.* 2: 767-776, 1989; Reddy *et al.*, *J. Virol.* 65: 1507-1515, 1991; Reddy *et al.*, *Proc. Natl. Acad. Sci. U.S.A.* 89: 6721-25, 1992; Skarnes *et al.*, *Genes Dev.* 6: 903-918, 1992; von Melchner and Ruley, *J. Virol.* 63: 3227-3233, 1989; and Yoshida *et al.*, *Transgen. Res.* 4: 277-87, 1995).

Promoter trap (5' trap) vectors contain, in 5' to 3' order, a splice acceptor sequence followed by an exon, which is typically characterized by a translation initiation codon and open reading frame (ORF) and/or an internal ribosome entry site. In general, these promoter trap vectors do not contain promoters or operably linked splice donor sequences. Consequently, after integration into the cellular genome of the host cell, the promoter trap vector sequence intercepts the normal splicing of the upstream gene and

acts as a terminal exon. Expression of the vector coding sequence is dependent upon the vector integrating into an intron of the disrupted gene in the proper reading frame. In such a case, the cellular splicing machinery splices exons from the trapped gene upstream of the vector coding sequence (Zambrowicz *et al.*, WO 99/50426).

5

An alternative method for producing an effect similar to the above-described promoter trap vector is a vector that incorporates a nested set of stop codons present in, or otherwise engineered into, the region between the splice acceptor of the promoter trap vector and the translation initiation codon or polyadenylation sequence. The coding sequence can also be engineered to contain an independent ribosome entry site (IRES) so that the coding sequence will be expressed in a manner largely independent of the site of integration within the host cell genome. Typically, but not necessarily, an IRES is used in conjunction with a nested set of stop codons.

15 Another type of gene trapping scheme uses a 3' gene trap vector. This type of vector contains, in operative combination, a promoter region, which mediates expression of an adjoining coding sequence, the coding sequence, and a splice donor sequence that defines the 3' end of the coding sequence exon. After integration into a host cell genome, the transcript expressed by the vector promoter is spliced to a splice acceptor sequence from the trapped gene that is located downstream of the integrated gene trap vector sequence. Thus, the integration of the vector results in the expression of a fusion transcript comprising the coding sequence of the 3' gene trap cassette and any downstream cellular exons, including the terminal exon and its polyadenylation signal. When such vectors integrate into a gene, the cellular splicing machinery splices the vector coding sequence upstream of the 3' exons of the trapped gene. One advantage of such vectors is that the expression of the 3' gene trap vectors is driven by a promoter within the gene trap cassette and does not require integration into a gene that is normally expressed in the host cell (Zambrowicz *et al.*, WO 99/50426). Examples of transcriptional promoters and enhancers that may be incorporated into the 3' gene trap vector include those discussed above with respect to targeting vectors.

The viral vector backbone used as the structural component for the promoter or 3' gene trap vector may be selected from a wide range of vectors that can be inserted into the genome of a target cell. Suitable backbone vectors include, but are not limited to, herpes simplex virus vectors, adenovirus vectors, adeno-associated virus vectors, retroviral vectors, lentiviral vectors, pseudorabies virus, alpha-herpes virus vectors, and the like. A thorough review of viral vectors, in particular, viral vectors suitable for modifying non-replicating cells and how to use such vectors in conjunction with the expression of an exogenous polynucleotide sequence, can be found in *Viral Vectors: Gene Therapy and Neuroscience Applications*, Eds. Caplitt and Loewy, Academic Press, San Diego, 1995.

Preferably, retroviral vectors are used for gene trapping. These vectors can be used in conjunction with retroviral packaging cell lines such as those described in U.S. Patent No. 5,449,614. Where non-murine mammalian cells are used as target cells for genetic modification, amphotropic or pantropic packaging cell lines can be used to package suitable vectors (Ory *et al.*, Proc. Natl. Acad. Sci., USA 93: 11400-11406, 1996). Representative retroviral vectors that can be adapted to create the presently described 3' gene trap vectors are described, for example, in U.S. Pat. No. 5,521,076.

The gene trapping vectors may contain one or more of the positive marker genes discussed above with respect to targeting vectors used for homologous recombination. Similar to their use in targeting vectors, these positive markers are used in gene trapping vectors to identify and select cells that have integrated the vector into the cell genome. The marker gene may be engineered to contain an independent ribosome entry site (IRES) so that the marker will be expressed in a manner largely independent of the location in which the vector has integrated into the target cell genome.

Given that gene trap vectors will integrate into the genome of infected host cells in a fairly random manner, a genetically modified cell having a disrupted PFI-013 gene must be identified from a population of cells that have undergone random vector integration. Preferably, the genetic modifications in the population of cells are of sufficient randomness and frequency such that the population represents mutations in essentially

every gene found in the cell's genome, making it likely that a cell with a disrupted PFI-013 gene will be identified from the population (see Zambrowicz *et al.*, WO 99/50426; Sands *et al.*, WO 98/14614).

- 5 Individual mutant cell lines containing a disrupted PFI-013 gene are identified in a population of mutated cells using, for example, reverse transcription and PCR (RT-PCR) to identify a mutation in a PFI-013 gene sequence. This process can be streamlined by pooling clones. For example, to find an individual clone containing a disrupted PFI-013 gene, RT-PCR is performed using one primer anchored in the gene
- 10 trap vector and the other primer located in the PFI-013 gene sequence. A positive RT-PCR result indicates that the vector sequence is encoded in the PFI-013 gene transcript, indicating that PFI-013 gene has been disrupted by a gene trap integration event (see, e.g., Sands *et al.*, WO 98/14614).

15 *Temporal, spatial, and inducible gene disruptions*

- A functional disruption of the endogenous PFI-013 gene can occur at specific developmental or cell cycle stages (temporal disruption) or in specific cell types (spatial disruption). The PFI-013 gene disruption can also be inducible when certain conditions
- 20 are present. A recombinase excision system, such as a Cre-Lox system, may be used to activate or inactivate the PFI-013 gene at a specific developmental stage, in a particular tissue or cell type, or under particular environmental conditions. Generally, methods utilizing Cre-Lox technology are carried out as described by Torres and Kuhn, *Laboratory Protocols for Conditional Gene Targeting*, Oxford University Press, 1997.
- 25 Methodology similar to that described for the Cre-Lox system can also be employed utilizing the FLP-FRT system. Further guidance regarding the use of recombinase excision systems for conditionally disrupting genes by homologous recombination or viral insertion is provided, for example, in U.S. Pat. No. 5,626,159, U.S. Pat. No. 5,527,695, U.S. Pat. No. 5,434,066, WO 98/29533, Orban *et al.*, Proc. Nat. Acad. Sci.
- 30 USA 89: 6861-65, 1992; O'Gorman *et al.*, Science 251: 1351-55, 1991; Sauer *et al.*, Nucleic Acids Research 17: 147-61, 1989; Barinaga, Science 265: 26-28, 1994; and

Akagi *et al.*, Nucleic Acids Res. 25: 1766-73, 1997. More than one recombinase system can be used to genetically modify an animal cell.

When using homologous recombination to disrupt the PFI-013 gene in a temporal, spatial, or inducible fashion, using a recombinase system such as the Cre-Lox system, a portion of the PFI-013 gene coding region is replaced by a targeting construct comprising the PFI-013 gene coding region flanked by loxP sites. Animal cells carrying this genetic modification contain a functional, loxP-flanked PFI-013 gene. The temporal, spatial, or inducible aspect of the PFI-013 gene disruption is caused by the expression pattern of an additional transgene, a Cre recombinase transgene, that is expressed in the animal cell under the control of the desired spatially-regulated, temporally-regulated, or inducible promoter, respectively. A Cre recombinase targets the loxP sites for recombination. Therefore, when Cre expression is activated, the LoxP sites undergo recombination to excise the sandwiched PFI-013 gene coding sequence, resulting in a functional disruption of the PFI-013 gene (Rajewski *et al.*, J. Clin. Invest. 98: 600-03, 1996; St-Onge *et al.*, Nucleic Acids Res. 24: 3875-77, 1996; Agah *et al.*, J. Clin. Invest. 100: 169-79, 1997; Brocard *et al.*, Proc. Natl. Acad. Sci. USA 94: 14559-63, 1997; Feil *et al.*, Proc. Natl. Acad. Sci. USA 93: 10887-90, 1996; and Kühn *et al.*, Science 269: 1427-29, 1995).

20

A cell containing both a Cre recombinase transgene and loxP-flanked PFI-013 gene can be generated through standard transgenic techniques. Further guidance regarding the use of recombinase systems specific promoters to temporally, spatially, or conditionally disrupt the PFI-013 gene is found, for example, in Sauer, Meth. Enz. 225: 890-900, 1993, Gu *et al.*, Science 265: 103-06, 1994, Araki *et al.*, J. Biochem. 122: 977-82, 1997, Dymecki, Proc. Natl. Acad. Sci. 93: 6191-96, 1996, and Meyers *et al.*, Nature Genetics 18: 136-41, 1998.

An inducible disruption of the PFI-013 gene can also be achieved by using a tetracycline responsive binary system (Gossen and Bujard, Proc. Natl. Acad. Sci. USA 89: 5547-51, 1992). This system involves genetically modifying a cell to introduce a Tet promoter into the endogenous PFI-013 gene regulatory element and a transgene

30

expressing a tetracycline-controllable repressor (TetR). In such a cell, the administration of tetracycline activates the TetR which, in turn, inhibits PFI-013 gene expression and, therefore, functionally disrupts the PFI-013 gene (St-Onge *et al.*, Nucleic Acids Res. 24: 3875-77, 1996, U.S. Patent No. 5,922,927).

5

The above-described systems for temporal, spatial, and inducible disruptions of the PFI-013 gene can also be adopted when using gene trapping as the method of genetic modification, for example, as described, for example, in WO 98/29533.

10 *Creating genetically modified animal cells*

The above-described methods for genetic modification can be used to functionally disrupt a PFI-013 gene in virtually any type of somatic or stem cell derived from an animal. Genetically modified animal cells of the invention include, but are not limited to, mammalian cells, including human cells, and avian cells. These cells may be derived from genetically engineering any animal cell line, such as culture-adapted, tumorigenic, or transformed cell lines, or they may be isolated from a genetically modified, non-human mammal carrying the desired PFI-013 genetic modification.

20 The cells may be heterozygous or homozygous for the disrupted PFI-013 gene. To obtain cells that are homozygous for the PFI-013 gene disruption (PFI-013^{-/-}), direct, sequential targeting of both alleles can be performed. This process can be facilitated by recycling a positive selectable marker. According to this scheme the nucleotide sequence encoding the positive selectable marker is removed following the disruption of one allele using the Cre-Lox P system. Thus, the same vector can be used in a subsequent round of targeting to disrupt the second PFI-013 gene allele (Abuin and Bradley, Mol. Cell. Biol. 16: 1851-56, 1996; Sedivy *et al.*, T.I.G. 15: 88-90, 1999; Cruz *et al.*, Proc. Natl. Acad. Sci. (USA) 88: 7170-74, 1991; Mortensen *et al.*, Proc. Natl. Acad. Sci. (USA) 88: 7036-40, 1991; te Riele *et al.*, Nature (London) 348: 649-651, 30 1990).

An alternative strategy for obtaining ES cells that are PFI-013^{-/-} is the homogenotization of cells from a population of cells that is heterozygous for the PFI-013 gene disruption (PFI-013^{+/-}). The method uses a scheme in which PFI-013^{+/-} targeted clones that express a selectable drug resistance marker are selected against a
5 very high drug concentration; this selection favours cells that express two copies of the sequence encoding the drug resistance marker and are, therefore, homozygous for the PFI-013 gene disruption (Mortensen *et al.*, Mol. Cell. Biol. 12: 2391-95, 1992).

Following the genetic modification of the desired cell or cell line, the PFI-013 gene
10 locus can be confirmed as the site of modification by PCR analysis according to standard PCR or Southern blotting methods known in the art (see, e.g., U.S. Pat. No. 4,683,202; and Erlich *et al.*, Science 252: 1643, 1991). Further verification of the functional disruption of the PFI-013 gene may also be made if PFI-013 gene messenger RNA (mRNA) levels and/or PFI-013 polypeptide levels are reduced in cells that
15 normally express the PFI-013 gene. Measures of PFI-013 gene mRNA levels may be obtained by using reverse transcriptase mediated polymerase chain reaction (RT-PCR), Northern blot analysis, or *in situ* hybridization. The quantification of PFI-013 polypeptide levels produced by the cells can be made, for example, by standard immunoassay methods known in the art. Such immunoassays include but are not
20 limited to, competitive and non-competitive assay systems using techniques such as radioimmunoassays, ELISA (enzyme-linked immunosorbent assay), "sandwich" immunoassays, immunoradiometric assays, gel diffusion precipitin reactions, immunodiffusion assays, *in situ* immunoassays (using colloidal gold, enzymatic, or radioisotope labels, for example), Western blots, 2-dimensional gel analysis,
25 precipitation reactions, immunofluorescence assays, protein A assays, and immunoelectrophoresis assays.

Preferred genetically modified animal cells are embryonic stem (ES) cells and ES-like cells. These cells are derived from the preimplantation embryos and blastocysts of
30 various species, such as mice (Evans *et al.*, Nature 129:154-156, 1981; Martin, Proc. Natl. Acad. Sci., USA, 78: 7634-7638, 1981), pigs and sheep (Notanianni *et al.*, J. Reprod. Fert. Suppl., 43: 255-260, 1991; Campbell *et al.*, Nature 380: 64-68, 1996) and

primates, including humans (Thomson *et al.*, U.S. Patent No. 5,843,780, Thomson *et al.*, Science 282: 1145-1147, 1995; and Thomson *et al.*, Proc. Natl. Acad. Sci. USA 92: 7844-7848, 1995).

- 5 These types of cells are pluripotent. That is, under proper conditions, they differentiate into a wide variety of cell types derived from all three embryonic germ layers: ectoderm, mesoderm and endoderm. Depending upon the culture conditions, a sample of ES cells can be cultured indefinitely as stem cells, allowed to differentiate into a wide variety of different cell types within a single sample, or directed to differentiate into a
- 10 specific cell type, such as macrophage-like cells, neuronal cells, cardiomyocytes, adipocytes, smooth muscle cells, endothelial cells, skeletal muscle cells, keratinocytes, and hematopoietic cells, such as eosinophils, mast cells, erythroid progenitor cells, or megakaryocytes. Directed differentiation is accomplished by including specific growth factors or matrix components in the culture conditions, as further described, for
- 15 example, in Keller *et al.*, Curr. Opin. Cell Biol. 7: 862-69, 1995, Li *et al.*, Curr. Biol. 8: 971, 1998, Klug *et al.*, J. Clin. Invest. 98: 216-24, 1996, Lieschke *et al.*, Exp. Hematol. 23: 328-34, 1995, Yamane *et al.*, Blood 90: 3516-23, 1997, and Hirashima *et al.*, Blood 93: 1253-63, 1999.
- 20 The particular embryonic stem cell line that is used for genetic modification is not critical; exemplary murine ES cell lines include AB-1 (McMahon and Bradley, Cell 62:1073-85, 1990), E14 (Hooper *et al.*, Nature 326: 292-95, 1987), D3 (Doetschman *et al.*, J. Embryol. Exp. Morph. 87: 27-45, 1985), CCE (Robertson *et al.*, Nature 323: 445-48, 1986), RW4 (Genome Systems, St. Louis, MO), and DBA/1lacJ (Roach *et al.*, Exp.
- 25 Cell Res. 221: 520-25, 1995).

PRODUCTION OF THE POLYPEPTIDE

- According to the present invention, the production of the polypeptide of the present
- 30 invention can be effected by the culturing of eukaryotic or prokaryotic expression hosts, which have been transformed with one or more polynucleotides of the present invention, in a conventional nutrient fermentation medium. The selection of the appropriate

medium may be based on the choice of expression hosts and/or based on the regulatory requirements of the expression construct. Such media are well-known to those skilled in the art. The medium may, if desired, contain additional components favouring the transformed expression hosts over other potentially contaminating micro-organisms.

5

Thus, the present invention also provides a method for producing a polypeptide having PFI-013 activity, the method comprising the steps of (a) transforming a host cell with a nucleotide sequence shown in SEQ ID NO: 1 or a derivative, homologue, variant, analogue or fragment thereof; and (b) culturing the transformed host cell under
10 conditions suitable for the expression of said polypeptide.

The present invention also relates to a method for producing a polypeptide having PFI-013 activity, the method comprising the steps of (a) culturing a host cell that has been transformed with a nucleotide sequence shown in SEQ ID NO: 1 or a derivative,
15 homologue, variant, analogue or fragment thereof under conditions suitable for the expression of said polypeptide; and (b) recovering said polypeptide from the host cell culture.

The present invention also relates to a method for producing a polypeptide having PFI-013 activity, the method comprising the steps of (a) transforming a host cell with a
20 nucleotide sequence shown in SEQ ID NO: 1 or a derivative, homologue, variant, analogue or fragment thereof; (b) culturing the transformed host cell under conditions suitable for the expression of said polypeptide; and (c) recovering said polypeptide from the host cell culture.

25

RIBOZYMES

Ribozymes are enzymatic RNA molecules capable of catalysing the specific cleavage of RNA. The mechanism of ribozyme action involves sequence specific hybridisation of
30 the ribozyme molecule to complementary target RNA, followed by endonucleolytic cleavage. Within the scope of the invention are engineered hammerhead motif

ribozyme molecules that specifically and efficiently catalyse endonucleolytic cleavage of PFI-013 RNA sequences.

Specific ribozyme cleavage sites within any potential RNA target are initially identified
5 by scanning the target molecule for ribozyme cleavage sites which include the following sequences: GUA, GUU and GUC. Once identified, short RNA sequences of between 15 and 20 ribonucleotides corresponding to the region of the target gene containing the cleavage site may be evaluated for secondary structural features which may render the oligonucleotide sequence inoperable. The suitability of candidate targets may also be
10 evaluated by testing accessibility to hybridisation with complementary oligonucleotides using ribonuclease protection assays.

Both antisense RNA and DNA molecules and ribozymes of the invention may be prepared by any method known in the art for the synthesis of RNA molecules. These
15 include techniques for chemically synthesising oligonucleotides such as solid phase phosphoramidite chemical synthesis. Alternatively, RNA molecules may be generated by *in vitro* or *in vivo* transcription of DNA sequences encoding the antisense RNA molecule. Such DNA sequences may be incorporated into a wide variety of vectors with suitable RNA polymerase promoters such as T7 or SP6. Alternatively, antisense
20 cDNA constructs that synthesize antisense RNA constitutively or inducibly can be introduced into cell lines, cells or tissues.

DETECTION

25 The presence of the PFI-013 polynucleotide coding sequence can be detected by DNA-DNA or DNA-RNA hybridisation or amplification using probes, portions or fragments of the sequence presented in SEQ ID NO: 1. Nucleic acid amplification-based assays involve the use of oligonucleotides or oligomers based on the PFI-013 coding sequence to detect transformants containing PFI-013 DNA or RNA. As used herein
30 "oligonucleotides" or "oligomers" may refer to a nucleic acid sequence of at least about 10 nucleotides and as many as about 60 nucleotides, preferably about 15 to 30 nucleotides, and more preferably about 20 to 25 nucleotides which can be used as a

probe or amplifier. Preferably, oligonucleotides are derived from the 3' region of the nucleotide sequence shown in SEQ ID NO: 1.

A variety of protocols for detecting and measuring the expression of PFI-013 polypeptide, such as by using either polyclonal or monoclonal antibodies specific for the protein, are known in the art. Examples include enzyme-linked immunosorbent assay (ELISA), radioimmunoassay (RIA) and fluorescent activated cell sorting (FACS). A two-site, monoclonal-based immunoassay utilising monoclonal antibodies reactive to two non-interfering epitopes on a PFI-013 polypeptide is preferred, but a competitive binding assay may also be employed. These and other assays are described, among other places, in Hampton R *et al.* (1990, Serological Methods, A Laboratory Manual, APS Press, St Paul, MN, USA) and Maddox DE *et al.* (1983, J Exp Med 15 8:1211).

A wide variety of labels and conjugation techniques are known by those skilled in the art and can be used in various nucleic and amino acid assays. Means for producing labelled hybridisation or PCR probes for detecting PFI-013 polynucleotide sequences include oligolabelling, nick translation, end-labelling or PCR amplification using a labelled nucleotide. Alternatively, the PFI-013 coding sequence, or any portion of it, may be cloned into a vector for the production of an mRNA probe. Such vectors are known in the art, are commercially available, and may be used to synthesize RNA probes *in vitro* by addition of an appropriate RNA polymerase such as T7, T3 or SP6 and labelled nucleotides.

A number of companies such as Amersham Pharmacia Biotech (Piscataway, NJ, USA), Promega (Madison, WI, USA), and US Biochemical Corporation (Cleveland, OH, USA) supply commercial kits and protocols for these procedures. Suitable reporter molecules or labels include those radionuclides, enzymes, fluorescent, chemiluminescent, or chromogenic agents as well as substrates, cofactors, inhibitors, magnetic particles and the like. Patents teaching the use of such labels include US-A-3817837; US-A-3850752; US-A-3939350; US-A-3996345; US-A-4277437; US-A-4275149 and US-A-4366241. Also, recombinant immunoglobulins may be produced as shown in US-A-4816567.

Additional methods to quantify the expression of a particular molecule include radiolabelling (Melby PC *et al.*, 1993, J. Immunol Methods Vol 159 p235-44) or biotinylating (Duplaa C *et al.*, 1993, Anal Biochem Vol 229 p36) nucleotides, co-
5 amplification of a control nucleic acid, and standard curves onto which the experimental results are interpolated. Quantification of multiple samples may be speeded up by running the assay in an ELISA format where the oligomer of interest is presented in various dilutions and a spectrophotometric or calorimetric response gives rapid quantification.

10

Although the presence/absence of marker gene expression suggests that the gene of interest is also present, its presence and expression should be confirmed. For example, if the PFI-013 coding sequence is inserted within a marker gene sequence, recombinant cells containing PFI-013 coding regions can be identified by the absence of marker gene
15 function. Alternatively, a marker gene can be placed in tandem with a PFI-013 coding sequence under the control of a single promoter. Expression of the marker gene in response to induction or selection usually indicates expression of PFI-013 as well.

Alternatively, host cells which contain the coding sequence for PFI-013 and express
20 PFI-013 coding regions may be identified by a variety of procedures known to those of skill in the art. These procedures include, but are not limited to, DNA-DNA or DNA-RNA hybridisation and protein bioassay or immunoassay techniques which include membrane-based, solution-based, or chip-based technologies for the detection and/or quantification of the nucleic acid or protein.

25

ANTIBODIES

The amino acid sequence of the present invention can also be used to generate antibodies - such as by use of standard techniques - against the amino acid sequence.

30

Procedures well known in the art may be used for the production of antibodies to PFI-013 polypeptides. Such antibodies include, but are not limited to, polyclonal,

monoclonal, chimeric, single chain, Fab fragments and fragments produced by a Fab expression library. Neutralising antibodies, i.e. those which antagonise biological activity of PFI-013 polypeptides, are especially preferred for diagnostics and therapeutics.

5

For the production of antibodies, various hosts including goats, rabbits, rats, mice, etc. may be immunised by injection with the PFI-013 polypeptide or any portion, variant, homologue, fragment, analogue or derivative thereof or oligopeptide which retains immunogenic properties. Depending on the host species, various adjuvants may be used to increase immunological response. Such adjuvants include, but are not limited to, Freund's, mineral gels such as aluminium hydroxide, and surface active substances such as lysolecithin, pluronic polyols, polyanions, peptides, oil emulsions, keyhole limpet hemocyanin, and dinitrophenol. BCG (*Bacilli Calmette-Guerin*) and *Corynebacterium parvum* are potentially useful human adjuvants which may be employed.

15

Monoclonal antibodies to the amino acid sequence may be prepared using any technique which provides for the production of antibody molecules by continuous cell lines in culture. These include, but are not limited to, the hybridoma technique originally described by Koehler and Milstein (1975, Nature Vol 256 p495-497), the human B-cell hybridoma technique (Kosbor *et al.* (1983) Immunol Today Vol 4 p72; Cote *et al.* (1983) Proceedings of the National Academy of Sciences (USA) Vol 80 p2026-2030) and the EBV-hybridoma technique (Cole *et al.* (1985) Monoclonal Antibodies and Cancer Therapy, Alan R Liss Inc, pp. 77-96). In addition, techniques developed for the production of "chimeric antibodies", the splicing of mouse antibody genes to human antibody genes to obtain a molecule with appropriate antigen specificity and biological activity can be used (Morrison *et al.* (1984) Proceedings of the National Academy of Sciences (USA) Vol 81 p6851-6855; Neuberger *et al.* (1984) Nature Vol 312 p604-608; Takeda *et al.* (1985) Nature Vol 314 p452-454). Alternatively, techniques described for the production of single chain antibodies (US-A-4946779) can be adapted to produce polypeptide-specific single chain antibodies.

30

Antibodies may also be produced by inducing *in vivo* production in the lymphocyte population or by screening recombinant immunoglobulin libraries or panels of highly specific binding reagents as disclosed in Orlandi *et al.* (1989, Proceedings of the National Academy of Sciences (USA) Vol 86 p 3833-3837), and Winter G and Milstein C (1991; Nature Vol 349 p293-299).

Antibody fragments which contain specific binding sites for PFI-013 may also be generated. For example, such fragments include, but are not limited to, the F(ab')₂ fragments which can be produced by pepsin digestion of the antibody molecule and the Fab fragments which can be generated by reducing the disulphide bridges of the F(ab')₂ fragments. Alternatively, Fab expression libraries may be constructed to allow rapid and easy identification of monoclonal Fab fragments with the desired specificity (Huse WD *et al.* (1989) Science Vol 256 p1275-1281).

An alternative technique involves screening phage display libraries where, for example the phage express scFv fragments on the surface of their coat with a large variety of complementarity determining regions (CDRs). This technique is well known in the art.

PFI-013-specific antibodies are useful for the diagnosis of conditions and diseases associated with expression of the PFI-013 receptor. A variety of protocols for competitive binding or immunoradiometric assays using either polyclonal or monoclonal antibodies with established specificities are well known in the art. Such immunoassays typically involve the formation of complexes between PFI-013 polypeptide and its specific antibody (or similar PFI-013-binding molecule) and the measurement of complex formation. A two-site, monoclonal based immunoassay utilising monoclonal antibodies reactive to two, non-interfering epitopes on a specific PFI-013 protein is preferred, but a competitive binding assay may also be employed. These assays are described in Maddox DE *et al.* (1983, Journal of Experimental Medicine Vol 158 p1211).

30

Anti-PFI-013 antibodies are useful for the diagnosis of disorders involving abnormal signal transduction or other disorders or diseases characterised by abnormal expression

of a PFI-013 receptor. Diagnostic assays for PFI-013 include methods utilising the antibody and a label to detect a PFI-013 polypeptide in human body fluids, cells, tissues or sections or extracts of such tissues. The polypeptides and antibodies of the present invention may be used with or without modification. Frequently, the polypeptides and antibodies will be labelled by joining them, either covalently or noncovalently, with a reporter molecule. A wide variety of reporter molecules are known to those of skill in the art.

Antibodies may be used in method of detecting polypeptides of the invention present in biological samples by a method which comprises: (a) providing an antibody of the invention; (b) incubating a biological sample with said antibody under conditions which allow for the formation of an antibody-antigen complex; and (c) determining whether antibody-antigen complex comprising said antibody is formed.

Antibodies of the invention may also be used for the enrichment or isolation of eosinophils from mammalian, preferably human blood. In a preferred embodiment of this aspect of the invention, the antibodies are bound to a solid support, e.g. magnetic beads, incubated with the peripheral blood leukocytes, then the beads with bound eosinophils are removed from the unbound cells using a magnet. Other similar methods for use of antibodies for isolation of specific cells from a mixture of cell types are well known to the person skilled in the art.

Antibodies of the invention may be bound to a solid support and/or packaged into kits in a suitable container along with suitable reagents, controls, instructions and the like.

ASSAYS/IDENTIFICATION METHODS

The present invention also relates to an assay method for detecting the presence of PFI-013 in cells (such as human cells) comprising: (a) performing a reverse transcriptase-polymerase chain reaction (RT-PCR) on RNA (such as total RNA) from such cells using a pair of PCR primers that are specific for PFI-013, as determined from the DNA sequence

shown in SEQ ID NO: 1 or an allelic variation thereof; and (b) assaying the appearance of an appropriately sized PCR fragment - such as by agarose gel electrophoresis.

There are numerous assays in which the polypeptide of the present invention can be used to screen for modulators (e.g. antagonists or agonists) of the polypeptide. Examples of such assays include:

Functional Assay - One example of a method for screening receptors to identify modulators thereof is to monitor the inhibitory or stimulatory effect on cAMP or adenylyl cyclase accumulation. Such an assay involves transfecting a mammalian cell with the receptor of the present invention for cell surface expression. The cell is then exposed to a putative modulator and the amount of cAMP accumulation is measured. If the putative modulator binds the receptor and has a functional effect, the levels of receptor-mediated cAMP or adenylyl cyclase activity will either increase or decrease.

15

Functional Assay using a Fluorometric Imaging Plate Reader (FLIPR®) - A technique used for screening and includes the use of cells that express the receptor of the present invention (for example, transfected HEK293 cells) in a system that measures intracellular calcium or extracellular pH changes caused by receptor activation. In this technique, cells expressing the receptor of the invention may be contacted with compounds (e.g. small molecules, peptides, lipids, nucleotides or glycoproteins) that cause a second messenger response, e.g. signal transduction, change in calcium levels or pH changes. These changes are used to determine whether the potential compound activates or inhibits the receptor.

20

Ligand Binding Assay - This type of assay may test binding of a candidate compound, where adherence to the cells containing the receptor of the present invention is detected by means of a label directly or indirectly associated with the candidate compound or in an assay involving competition with a labelled competitor. Standard assays for conducting screens that determine if the compound activates or inhibits the receptor are well understood by those skilled in the art.

25

30

The present invention therefore also relates to a method of identifying agents (such as compounds, other substances or compositions comprising the same) that affect (such as antagonise, agonise or otherwise modify) the activity of PFI-013 and/or the expression thereof, the method comprising contacting PFI-013 or the nucleotide sequence coding for the same with the agent and then measuring the activity of PFI-013 and/or the expression thereof.

The present invention also relates to a method of identifying agents (such as compounds, other substances or compositions comprising the same) that selectively affect (such as antagonise, agonise or otherwise modify) the activity of PFI-013 and/or the expression thereof, the method comprising contacting PFI-013 or the nucleotide sequence coding for the same with the agent and then measuring the activity of PFI-013 and/or the expression thereof.

The present invention also relates to a method of identifying agents (such as compounds, other substances or compositions comprising the same) that affect (such as antagonise, agonise or otherwise modify) the activity of PFI-013 and/or the expression thereof, the method comprising measuring the activity of PFI-013 and/or the expression thereof in the presence of the agent or after the addition of the agent in: (a) a cell line into which has been incorporated recombinant DNA comprising the DNA sequence shown in SEQ ID NO: 1 or an allelic variation thereof, or (b) a cell population or cell line that naturally selectively expresses PFI-013. Preferably, the activity of PFI-013 is determined by the assay methods described above.

The present invention also relates to a method of identifying agents (such as compounds, other substances or compositions comprising the same) that selectively affect (such as antagonise, agonise or otherwise modify) the activity of PFI-013 and/or the expression thereof, the method comprising measuring the activity of PFI-013 and/or the expression thereof in the presence of the agent or after the addition of the agent in: (a) a cell line into which has been incorporated recombinant DNA comprising the DNA sequence shown in SEQ ID NO: 1 or an allelic variation thereof, or (b) a cell population or cell line that

naturally selectively expresses PFI-013. Preferably, the activity of PFI-013 is determined by the assay methods described above.

The present invention also relates to a method of screening an agent for modulation
5 (preferably for specific modulation) of PFI-013 (or a derivative, homologue, variant, analogue or fragment thereof) activity or the expression of the nucleotide sequence coding for the same (including a derivative, homologue, variant, analogue or fragment thereof), the method comprising the steps of: (a) providing a candidate agent; (b) combining PFI-013 (or the derivative, homologue, variant, analogue or fragment
10 thereof) or the nucleotide sequence coding for the same (or the derivative, homologue, variant, analogue or fragment thereof) with the candidate agent for a time sufficient to allow modulation under suitable conditions; and (c) detecting modulation of the candidate agent to PFI-013 (or the derivative, homologue, variant, analogue or fragment thereof) or the nucleotide sequence coding for the same (or the derivative, homologue,
15 variant, analogue or fragment thereof) in order to ascertain if the candidate agent modulates PFI-013 (or the derivative, homologue, variant, analogue or fragment thereof) activity or the expression of the nucleotide sequence coding for the same (or the derivative, homologue, variant, analogue or fragment thereof).

20 The present invention also relates to a method of screening an agent for specific binding affinity with PFI-013 (or a derivative, homologue, variant, analogue or fragment thereof) or the nucleotide sequence coding for the same (including a derivative, homologue, variant, analogue or fragment thereof), the method comprising the steps of: (a) providing a candidate agent; (b) combining PFI-013 (or the derivative, homologue,
25 variant, analogue or fragment thereof) or the nucleotide sequence coding for the same (or the derivative, homologue, variant, analogue or fragment thereof) with the candidate agent for a time sufficient to allow binding under suitable conditions; and (c) detecting binding of the candidate agent to PFI-013 (or the derivative, homologue, variant, analogue or fragment thereof) or the nucleotide sequence coding for the same (or the
30 derivative, homologue, variant, analogue or fragment thereof) in order to ascertain if the candidate agent binds to PFI-013 (or the derivative, homologue, variant, analogue or

fragment thereof) or the nucleotide sequence coding for the same (or the derivative, homologue, variant, analogue or fragment thereof).

Thus, in certain embodiments of the present invention, PFI-013 or a variant, homologue, fragment, analogue or derivative thereof and/or a cell line that expresses the PFI-013 or variant, homologue, fragment, analogue or derivative thereof may be used to screen for antibodies, peptides, or other agents, such as organic or inorganic molecules, that act as modulators (e.g. antagonists or agonists) of PFI-013 activity or for the expression thereof, thereby identifying a therapeutic agent capable of modulating the receptor.

Alternatively, screening of peptide libraries or organic libraries made by combinatorial chemistry with recombinantly expressed PFI-013 or a variant, homologue, fragment, analogue or derivative thereof or cell lines expressing PFI-013 or a variant, homologue, fragment, analogue or derivative thereof may be useful for identification of therapeutic agents that function by modulating the receptor. Synthetic compounds, natural products, and other sources of potentially biologically active materials can be screened in a number of ways deemed to be routine to those of skill in the art. For example, nucleotide sequences encoding the N-terminal region of PFI-013 may be expressed in a cell line, which can be used for screening of allosteric modulators, either agonists or antagonists, of PFI-013 activity.

A PFI-013 polypeptide, its immunogenic fragments or oligopeptides thereof can be used for screening therapeutic compounds in any of a variety of drug screening techniques. The polypeptide employed in such a test may be free in solution, affixed to a solid support, borne on a cell surface, or located intracellularly. The formation of binding complexes between a PFI-013 polypeptide and the agent being tested may be measured.

Accordingly, the present invention relates to a method for screening one or a plurality of compounds for modulation (preferably specific modulation, such as specific binding affinity) of PFI-013 or the expression thereof, or a portion thereof or variant, homologue, fragment, analogue or derivative thereof, comprising providing one or a plurality of compounds; combining a PFI-013 or a nucleotide sequence coding for the same or a portion thereof or variant, homologue, fragment, analogue or derivative

thereof with the or each of a plurality of compounds for a time sufficient to allow modulation under suitable conditions; and detecting binding of a PFI-013, or portion thereof or variant, homologue, fragment, analogue or derivative thereof, to each of the plurality of compounds, thereby identifying the compound or compounds which
5 modulate a PFI-013 or a nucleotide sequence coding for the same. In such an assay, the plurality of compounds may be produced by combinatorial chemistry techniques known to those of skill in the art.

Another technique for drug screening provides for high throughput screening (HTS) of
10 compounds having suitable binding affinity to the PFI-013 polypeptides and is based upon the method described in detail in Geysen, WO 84/03564, published on September 13, 1984. In summary, large numbers of different small peptide test compounds are synthesized on a solid substrate, such as plastic pins or some other surface. The peptide test compounds are reacted with PFI-013 fragments and washed. A bound PFI-013 is
15 then detected - such as by appropriately adapting methods well known in the art. A purified PFI-013 can also be coated directly onto plates for use in the aforementioned drug screening techniques. Alternatively, non-neutralising antibodies can be used to capture the peptide and immobilise it on a solid support.

20 This invention also contemplates the use of competitive drug screening assays in which neutralising antibodies capable of binding a PFI-013 polypeptide specifically compete with a test compound for binding a PFI-013. In this manner, the antibodies can be used to detect the presence of any peptide which shares one or more antigenic determinants with a PFI-013.

25

The assay method of the present invention may be a high throughput screen (HTS). In this regard, the teachings of WO 84/03564 may be adapted for the PFI-013 of the present invention.

30 The teachings of US-A-5738985 may also be adapted for the assay method of the present invention.

AGENTS

The present invention also provides one or more agents identified by the assays methods and identification methods of the present invention.

5

The agent of the present invention can be, for example, an organic compound or an inorganic compound. The agent can be, for example, a nucleotide sequence that is antisense to all or part of the sequence shown in SEQ ID NO: 1.

10 The invention further provides an agent of the present invention (or even a pharmaceutically acceptable salt thereof, or a pharmaceutically acceptable solvate thereof) or a pharmaceutical composition containing any of the foregoing, for use as a medicament.

15 The present invention also relates to the use of an agent to affect PFI-013 activity (such as to antagonise, modulate or agonise its GPCR activity).

DIAGNOSTICS

20 The present invention also provides a diagnostic composition for the detection of PFI-013 polynucleotide sequences. The diagnostic composition may comprise the sequence shown in SEQ ID NO: 1 or a variant, homologue, fragment, analogue or derivative thereof, or a sequence capable of hybridising to all or part of the nucleotide sequence shown in SEQ ID NO: 1 or an allelic variation thereof.

25

In order to provide a basis for the diagnosis of disease, normal or standard values from a PFI-013 polypeptide expression should be established. This is accomplished by combining body fluids or cell extracts taken from normal subjects, either animal or human, with antibody to a PFI-013 polypeptide under conditions suitable for complex
30 formation which are well known in the art. The amount of standard complex formation may be quantified by comparing it to a dilution series of positive controls where a known amount of antibody is combined with known concentrations of a purified PFI-

013 polypeptide. Then, standard values obtained from normal samples may be compared with values obtained from samples from subjects potentially affected by a disorder or disease related to a PFI-013 polypeptide expression. Deviation between standard and subject values establishes the presence of the disease state.

5

A PFI-013 polynucleotide, or any part thereof, may provide the basis for a diagnostic and/or a therapeutic compound. For diagnostic purposes, PFI-013 polynucleotide sequences may be used to detect and quantify gene expression in conditions, disorders or diseases in which PFI-013 activity may be implicated.

10

PFI-013-encoding polynucleotide sequence may be used for the diagnosis of diseases resulting from expression of PFI-013. For example, polynucleotide sequences encoding PFI-013 may be used in hybridisation or PCR assays of tissues from biopsies or autopsies or biological fluids, such as serum, synovial fluid or tumour biopsy, to detect
15 abnormalities in PFI-013 expression. The form of such qualitative or quantitative methods may include Southern or northern analysis, dot blot or other membrane-based technologies; PCR technologies; dip stick, pin or chip technologies; and ELISA or other multiple sample format technologies. All of these techniques are well known in the art and are, in fact, the basis of many commercially available diagnostic kits.

20

Such assays may be tailored to evaluate the efficacy of a particular therapeutic treatment regime and may be used in animal studies, in clinical trials, or in monitoring the treatment of an individual patient. In order to provide a basis for the diagnosis of disease, a normal or standard profile for PFI-013 expression should be established. This
25 is accomplished by combining body fluids or cell extracts taken from normal subjects, either animal or human, with PFI-013 or a portion thereof, under conditions suitable for hybridisation or amplification. Standard hybridisation may be quantified by comparing the values obtained for normal subjects with a dilution series of positive controls run in the same experiment where a known amount of purified PFI-013 is used. Standard
30 values obtained from normal samples may be compared with values obtained from samples from subjects potentially affected by a disorder or disease related to expression of the PFI-013 coding sequence. Deviation between standard and subject values

establishes the presence of the disease state. If disease is established, an existing therapeutic agent is administered, and treatment profile or values may be generated. Finally, the assay may be repeated on a regular basis to evaluate whether the values progress toward or return to the normal or standard pattern. Successive treatment
5 profiles may be used to show the efficacy of treatment over a period of several days or several months.

Thus, the present invention relates to the use of a PFI-013 polypeptide, or variant, homologue, fragment, analogue or derivative thereof, to produce anti-PFI-013
10 antibodies which can, for example, be used diagnostically to detect and quantify PFI-013 levels in disease states.

The present invention further relates to diagnostic assays and kits for the detection of PFI-013 in cells and tissues comprising a purified PFI-013 which may be used as a
15 positive control, and anti-PFI-013 antibodies. Such antibodies may be used in solution-based, membrane-based, or tissue-based technologies to detect any disease state or condition related to the expression of PFI-013 protein or expression of deletions or a variant, homologue, fragment, analogue or derivative thereof.

20 Alternatively, the present invention provides a process for diagnosing in a patient a disease or a susceptibility to a disease related to an under-expression of PFI-013 comprising: determining a mutation in the nucleic acid sequence encoding PFI-013, or the amount of the PFI-013 in a sample derived from a patient. There is also provided a diagnostic process comprising analysing for the presence of PFI-013 in a sample
25 derived from a host.

PROBES

Another aspect of the subject invention is the provision of nucleic acid hybridisation or
30 PCR probes which are capable of detecting polynucleotide sequences, including genomic sequences, encoding PFI-013 coding region or closely related molecules, such as alleles. The specificity of the probe, i.e. whether it is derived from a highly

conserved, conserved or non-conserved region or domain, and the stringency of the hybridisation or amplification (high, intermediate or low) will determine whether the probe identifies only naturally occurring PFI-013 coding sequence, or related sequences. Probes for the detection of related nucleic acid sequences are selected from conserved or highly conserved nucleotide regions of PFI-013 polynucleotides, such as the 3' region, and such probes may be used in a pool of degenerate probes. For the detection of identical nucleic acid sequences, or where maximum specificity is desired, nucleic acid probes are selected from the non-conserved nucleotide regions or unique regions of PFI-013 polynucleotides. As used herein, the term "non-conserved nucleotide region" refers to a nucleotide region that is unique to the PFI-013 coding sequence disclosed herein and does not occur in related sequences.

PCR, as described in US-A-4683195, US-A-4800195 and US-A-4965188 provides additional uses for oligonucleotides based upon the PFI-013 sequence. Such oligomers are generally chemically synthesized, but they may be generated enzymatically or produced from a recombinant source. Oligomers generally comprise two nucleotide sequences, one with sense orientation (5'→3') and one with antisense (3'←5') employed under optimised conditions for identification of a specific gene or condition. The same two oligomers, nested sets of oligomers, or even a degenerate pool of oligomers may be employed under less stringent conditions for detection and/or quantification of closely related DNA or RNA sequences.

The nucleic acid sequence for PFI-013 can also be used to generate hybridisation probes as previously described, for mapping the endogenous genomic sequence. The sequence may be mapped to a particular chromosome or to a specific region of the chromosome using well known techniques. These include *in situ* hybridisation to chromosomal spreads (Verma *et al.* (1988) Human Chromosomes: A Manual of Basic Techniques, Pergamon Press, New York City, USA), flow-sorted chromosomal preparations, or artificial chromosome constructions such as yeast artificial chromosomes (YACs), bacterial artificial chromosomes (BACs), bacterial PI constructions or single chromosome cDNA libraries.

In situ hybridisation of chromosomal preparations and physical mapping techniques such as linkage analysis using established chromosomal markers are invaluable in extending genetic maps. Examples of genetic maps can be found in Science (1995; 270:410f and 1994; 265:1981f). Often the placement of a gene on the chromosome of another mammalian species may reveal associated markers even if the number or arm of a particular human chromosome is not known. New sequences can be assigned to chromosomal arms, or parts thereof, by physical mapping. This provides valuable information to investigators searching for disease genes using positional cloning or other gene discovery techniques. Once a disease or syndrome, such as ataxia telangiectasia (AT), has been crudely localised by genetic linkage to a particular genomic region, for example, AT to 11q22-23 (Gatti *et al.* (1988) Nature 336:577-580), any sequences mapping to that area may represent associated or regulatory genes for further investigation. The nucleotide sequence of the subject invention may also be used to detect differences in the chromosomal location due to translocation, inversion, etc. between normal, carrier or affected individuals.

PHARMACEUTICALS

The present invention also provides a pharmaceutical composition for treating an individual in need of the same due to PFI-013 activity, the composition comprising a therapeutically effective amount of an agent that modulates (such as antagonises or agonises) said activity and a pharmaceutically acceptable carrier, diluent, excipient or adjuvant.

Thus, the present invention also covers pharmaceutical compositions comprising the agents of the present invention (an agent capable of modulating the expression pattern of the nucleotide sequence of the present invention or the activity of the expression product thereof and/or an agent identified by an assay according to the present invention). In this regard, and in particular for human therapy, even though the agents of the present invention can be administered alone, they will generally be administered in admixture with a pharmaceutical carrier, adjuvant, excipient or diluent selected with regard to the intended route of administration and standard pharmaceutical practice.

By way of example, in the pharmaceutical compositions of the present invention, the agents of the present invention may be admixed with any suitable binder(s), lubricant(s), suspending agent(s), coating agent(s), or solubilising agent(s).

5

In general, a therapeutically effective daily oral or intravenous dose of the agents of the present invention is likely to range from 0.01 to 50 mg/kg body weight of the subject to be treated, preferably 0.1 to 20 mg/kg. The agents of the present invention may also be administered by intravenous infusion, at a dose which is likely to range from 0.001-10
10 mg/kg/hr.

Thus, the present invention also provides a method of treating an individual in need of the same due to PFI-013 activity comprising administering to said individual an effective amount of the pharmaceutical composition of the present invention.

15

Typically, the physician will determine the actual dosage which will be most suitable for an individual patient and it will vary with the age, weight, sex and response of the particular patient. The above dosages are exemplary of the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited, and
20 such are within the scope of this invention.

Where appropriate, the pharmaceutical compositions can be administered by inhalation, in the form of a suppository or pessary, topically in the form of a lotion, solution, cream, ointment or dusting powder, by use of a skin patch, orally in the form of tablets
25 containing excipients such as starch or lactose, or in capsules or ovules either alone or in admixture with excipients, or in the form of elixirs, solutions or suspensions containing flavouring or colouring agents, or they can be injected parenterally, for example intracavernosally, intravenously, intramuscularly or subcutaneously. For parenteral administration, the compositions may be best used in the form of a sterile aqueous
30 solution which may contain other substances, for example enough salts or monosaccharides to make the solution isotonic with blood. For buccal or sublingual

administration the compositions may be administered in the form of tablets or lozenges which can be formulated in a conventional manner.

For oral, parenteral, buccal and sublingual administration to subjects (such as patients),
5 the daily dosage level of the agents of the present invention may typically be from 10 to 500 mg (in single or divided doses). Thus, and by way of example, tablets or capsules may contain from 5 to 100 mg of active agent for administration singly, or two or more at a time, as appropriate. It is also possible to administer the agents of the present invention in sustained release formulations.

10 In some applications, generally in humans, oral administration of the agents of the present invention is the preferred route, being the most convenient and can in some cases avoid disadvantages associated with other routes of administration - such as those associated with intracavernosal (i.c.) administration. In circumstances where the
15 recipient suffers from a swallowing disorder or from impairment of drug absorption after oral administration, the drug may be administered parenterally, sublingually or buccally.

For veterinary use, the agent of the present invention is typically administered as a
20 suitably acceptable formulation in accordance with normal veterinary practice and the veterinary surgeon will determine the dosing regimen and route of administration which will be most appropriate for a particular animal. However, as with human treatments, it may be possible to administer the agent alone for veterinary treatments.

25 Typically, the pharmaceutical compositions - which may be for human or animal usage - will comprise any one or more of a pharmaceutically acceptable diluent, carrier, excipient or adjuvant. The choice of pharmaceutical carrier, excipient, adjuvant or diluent can be selected with regard to the intended route of administration and standard pharmaceutical practice. As indicated above, the pharmaceutical compositions may
30 comprise as - or in addition to - the carrier, excipient, adjuvant or diluent any suitable binder(s), lubricant(s), suspending agent(s), coating agent(s) or solubilising agent(s).

In some embodiments of the present invention, the pharmaceutical compositions will comprise one or more of: an agent that has been screened by an assay of the present invention; an agent that is capable of interacting with SEQ ID NO: 1 or SEQ ID NO: 2 including derivatives, fragments, homologues, analogues or variants thereof or
5 sequences capable of hybridising to the nucleotide sequence shown in SEQ ID NO: 1.

Included in the scope of the invention are oligonucleotide sequences, antisense RNA and DNA molecules and ribozymes, which function to destabilise PFI-013 mRNA or inhibit translation of PFI-013.

10

A PFI-013 antisense molecule may provide the basis for treatment of various abnormal conditions related to, for example, increased PFI-013 activity.

15

Expression vectors derived from retroviruses, adenovirus, herpes or vaccinia viruses, or from various bacterial plasmids, may be used for delivery of recombinant PFI-013 sense or antisense molecules to the targeted cell population. Methods which are well known to those skilled in the art can be used to construct recombinant vectors containing PFI-013. Alternatively, recombinant PFI-013 can be delivered to target cells in liposomes.

20

The full length cDNA sequence and/or its regulatory elements enable researchers to use PFI-013 as a tool in sense (Youssoufian H and HF Lodish (1993) Mol Cell Biol 13:98-104) or antisense (Eguchi *et al* (1991) Annu Rev Biochem 60:631-652) investigations of gene function. Oligonucleotides, designed from the cDNA or control sequences obtained from the genomic DNA can be used *in vitro* or *in vivo* to inhibit expression.

25

Such technology is now well known in the art, and sense or antisense oligonucleotides or larger fragments can be designed from various locations along the coding or control regions. Appropriate oligonucleotides, which can be 20 nucleotides in length, may be used to isolate PFI-013 sequences or closely related molecules from human libraries.

30

Additionally, PFI-013 expression can be modulated by transfecting a cell or tissue with expression vectors which express high levels of a PFI-013 fragment in conditions where it would be preferable to block PFI-013 activity. Such constructs can flood cells with

untranslatable sense or antisense sequences. Even in the absence of integration into the DNA, such vectors may continue to transcribe RNA molecules until all copies of the vector are disabled by endogenous nucleases. Such transient expression may last for a month or more with a non-replicating vector and even longer if appropriate replication
5 elements are part of the vector system.

Modifications of gene expression can be obtained by designing antisense sequences to the control regions of the PFI-013 gene, such as the promoters, enhancers, and introns.

- 10 Oligonucleotides derived from the transcription initiation site, e.g. between -10 and +10 regions of the leader sequence, are preferred. Antisense RNA and DNA molecules may also be designed to block translation of mRNA by preventing the transcript from binding to ribosomes. Similarly, inhibition can be achieved using Hogeboom base-pairing methodology, also known as "triple helix" base-pairing. Triple helix pairing
15 compromises the ability of the double helix to open sufficiently for the binding of polymerases, transcription factors, or regulatory molecules.

Thus the invention provides a pharmaceutical composition comprising an agent of the present invention (or even a pharmaceutically acceptable salt thereof, or a
20 pharmaceutically acceptable solvate thereof) together with a pharmaceutically acceptable diluent, adjuvant, excipient or carrier.

The pharmaceutical composition could be for veterinary (i.e. animal) usage or for human usage.

25

Thus, the present invention therefore also relates to pharmaceutical compositions comprising effective amounts of modulators (e.g. antagonists or agonists) of PFI-013 protein (including antisense nucleic acid sequences) in admixture with a pharmaceutically acceptable diluent, carrier, excipient or adjuvant (including
30 combinations thereof).

The present invention relates to pharmaceutical compositions which may comprise all or portions of PFI-013 polynucleotide sequences, PFI-013 antisense molecules, PFI-013 polypeptides, protein, peptide or organic modulators of PFI-013 bioactivity, such as antagonists (including antibodies) or agonists, alone or in combination with at least one
5 other agent, such as stabilising compound, and may be administered in any sterile, biocompatible pharmaceutical carrier, including, but not limited to, saline, buffered saline, dextrose, and water.

DEPOSITS

The following sample was deposited in accordance with the Budapest Treaty at the
20 recognised depositary The National Collections of Industrial and Marine Bacteria Limited (NCIMB) at 23 St. Machar Drive, Aberdeen, Scotland, AB2 1RY, United Kingdom on 23 August 2000:

NCIMB number NCIMB 41073 is *Escherichia coli* Pfi-013.

25

The depositor was Pfizer Central Research, Pfizer Limited, Ramsgate Road, Sandwich, Kent, CT13 9NJ, United Kingdom.

One skilled in the art could readily grow the above-mentioned *E. coli* clone (NCIMB
30 41073) in Luria Broth containing ampicillin and isolate the plasmid DNA of the clone using the alkali lysis method as described in Sambrook, *et al.*, eds. (1989) Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory Press, New York, NY,

USA. The di-deoxy termination method as described by Sanger *et al.* (Proceedings of the National Academy of Sciences (USA) (Dec. 1977), 74(12):5463-5467) and modified by Applied Biosystems (see Applied Biosystems manufacturer's literature) for fluorescent detection could then be used to sequence the DNA and identify PFI-013.

5

The present invention also encompasses sequences derivable and/or expressable from that deposit and embodiments comprising the same. The present invention also encompasses partial sequences derivable and/or expressable from that deposit and embodiments comprising the same, wherein those partial sequences code for active polypeptides. The present invention also encompasses proteins comprising sequences derivable and/or expressable from that deposit and embodiments comprising the same. The present invention also encompasses proteins comprising partial sequences derivable and/or expressable from that deposit and embodiments comprising the same, wherein those partial sequences code for active polypeptides.

15

INTRODUCTION TO THE EXAMPLES SECTION, THE FIGURES AND THE SEQUENCE LISTING

The present invention will now be described, by way of example only, with reference to the accompanying Figures and Sequence Listing in which:-

20

Figure 1 shows a schema for the bioinformatic analysis of PFI-013 (db = database).

Figure 2 shows a ClustalW alignment of PFI-013 with the human histamine H3 receptor (a vertical line (|) between amino acid residues denotes identity; a colon mark (:) between amino acid residues denotes conservative substitution).

25

Figure 3 shows, diagrammatically, the genomic structures of the PFI-013 gene and the human histamine H3 receptor gene ("rectangular blocks" = exons; ^ = introns; the numbers directly below the "rectangular blocks" indicate (1) amino acid residues, for the human H3 diagram and (2) base pairs within the contig, for the PFI-013 diagram).

30

Figure 4 shows a Northern blot, indicating the tissue distribution of PFI-013 mRNA.

Figure 5 shows the results of quantitative PCR analysis of mRNA from various tissues by Taqman® (P.B.Leukocyte = peripheral blood leukocytes; Sm. Intestine = small intestine; Skel. Muscle = skeletal muscle).

Figure 6 shows the results of a filter ligand-binding assay - expressed as the difference in radioactive ^3H -histamine bound to the membranes of PFI-013-transfected and mock-transfected cells (CPM = counts per minute of radioactivity; [Ligand] = concentration of ^3H -histamine in nM).

Figure 7 shows the activation of PFI-013-expressing HEK293 cells by histamine in a fluorescent-based functional assay (FLIPR®). **Figure 7A** shows a cell-based assay, indicating the effect of histamine on HEK293 cells (expressing $\text{G}\alpha 15$) transfected with a PFI-013-expression construct. **Figure 7B** shows the same cell-based assay, but indicating the effect of histamine on HEK293 cells (expressing $\text{G}\alpha 15$) transfected with vector only. A peak in a square indicates a transient increase in the intracellular calcium concentration in the corresponding well, and therefore indicates a functional response by the cells resulting from the respective treatment.

20

Figure 8 shows the activation of PFI-013-expressing HEK293 cells by various histamine agonists (histaminergic ligands) in a fluorescent-based functional assay (FLIPR®). **Figure 8A** shows a cell-based assay, indicating the effect of histamine agonists on HEK293 cells (expressing $\text{G}\alpha 15$) transfected with a PFI-013-expression construct. **Figure 8B** shows the same cell-based assay, but indicating the effect of histamine agonists on HEK293 cells (expressing $\text{G}\alpha 15$) transfected with vector only. A peak in a square indicates a transient increase in the intracellular calcium concentration in the corresponding well, and therefore indicates a functional response by the cells resulting from the respective treatment.

30

Figure 9 shows the results of human eosinophil chemotaxis assays with various histamine receptor subtype-selective agonists.

Figure 10 shows the effects of various histamine receptor subtype-selective antagonists on histamine-induced human eosinophil chemotaxis. **Figure 10A** shows histamine-induced eosinophil chemotaxis and the enhancing effect of interleukin-5 (IL-5) pretreatment of the eosinophils. **Figure 10B** shows inhibition of histamine-induced chemotaxis by various histamine antagonists (CPD = compound). **Figure 10C** shows a dose-response curve of two histamine antagonists on histamine-induced eosinophil chemotaxis.

SEQ ID NO: 1 shows the nucleotide sequence coding for PFI-013. The ATG translation initiation codon is indicated by the first three letters. The stop codon is indicated by the last three letters.

SEQ ID NO: 2 shows the corresponding amino acid sequence coding for PFI-013.

15

SEQ ID NOS: 3-10 show the PCR primers used in the Examples.

The polynucleotide which encodes the GPCR of the present invention was cloned and the DNA and amino acid sequences analysed using various bioinformatic tools. The GPCR encoded by the sequences described herein has been termed PFI-013.

20

Experimental section

Example 1

5 IDENTIFICATION OF PFI-013

PFI-013 was first identified in an expressed sequence tag (EST) database with sequences derived from a cDNA library from eosinophils stimulated with IL-5, but only as a partial sequence. Searching of the public genomic databases led to the
10 identification of the full length PFI-013 sequence and the determination of its homology to histamine H3 receptors using, *inter alia*, the BLAST algorithm.

Example 2

15 BIOINFORMATIC STUDIES

In order to confirm that PFI-013 was a member of the GPCR family, a number of bioinformatics approaches were performed (see Figure 1).

20 (a) BLAST Search against Swissprot

PFI-013 was searched against Swissprot using the BLAST algorithm (Basic Local Alignment Search Tool (Altschul SF (1993) J.Mol. Evol. 36:290-300; Altschul, SF
25 *et al.* (1990) J. Mol. Biol. 215:403-410; Altschul, SF *et al.* (1997) Nucleic Acids Res. 25: 3389-3402)) to identify the closest protein match. In this case the top hit was to:

AF140538-01 PRI AAD38151.1 Homo sapiens histamine H3 receptor mRNA, complete coding sequence (CDS).

30 These results indicate that PFI-013 is a member of the GPCR family.

(b) ClustalW Alignment of PFI-013 with human histamine H3 receptor

These results are shown in Figure 2.

5

(c) Genomic organisation of the genes for PFI-013 and human histamine H3 receptors

The genes for PFI-013 and histamine H3 receptors have a very similar structure, as shown in Figure 3. Figure 3 also shows the part of the sequence originally identified as the EST in the eosinophil cDNA library.

10

(d) BLAST search against a non-redundant human GPCR database

PFI-013 was searched against a non-redundant human GPCR database comprising mainly sequences from Genbank and Geneseq Patents databases in order to identify the class of agonist for this receptor. The top ten hits are shown below:

Sequences producing significant alignments:				Score (bits)	E Value
AF140538	GPCR0022	11	Histamine H3 receptor	268	7e-74 GO
A1AB_HUMAN	GPCR0007	8	Alpha-1B adrenergic receptor	145	8e-37 GO
5H1D_HUMAN	GPCR0025	12	5-hydroxytryptamine 1D receptor (5-HT...	136	4e-34 GO
25 5H1F_HUMAN	GPCR0027	12	5-hydroxytryptamine 1F receptor (5-HT...	134	2e-33 GO
5H1B_HUMAN	GPCR0024	12	5-hydroxytryptamine 1B receptor (5-HT...	132	6e-33 GO
A1AD_HUMAN	GPCR0008	8	Alpha-1D adrenergic receptor	132	1e-32 GO
D3DR_HUMAN	GPCR0016	10	D(3) dopamine receptor	127	2e-31 GO
ACM3_HUMAN	GPCR0003	6	Muscarinic acetylcholine receptor M3	118	2e-28 GO
30 ACM5_HUMAN	GPCR0005	6	Muscarinic acetylcholine receptor M5	109	6e-26 GO
ACM2_HUMAN	GPCR0002	6	Muscarinic acetylcholine receptor M2	106	5e-25 GO

(E Value = statistical likelihood of the hit occurring by chance)

35 These results demonstrate that PFI-013 is most similar to histamine receptors, and they suggest that PFI-013 encodes a novel GPCR whose ligand is likely to be an amine.

Example 3**ISOLATION OF PFI-013**

- 5 Total RNA was extracted from 1×10^8 AML14.3D10 cells, obtained from Dr. C.C. Paul, VA Medical Center, Dayton, Ohio, USA (Baumann, M.A. & Paul, C. C. (1998) Stem Cells 16: 16-24), using the Qiagen RNeasy Maxi kit according to manufacturer's recommendations. mRNA was subsequently isolated from the aforementioned total RNA using a Qiagen oligotex mRNA purification kit, according to the manufacturer's
- 10 recommendations. 1 μ g of AML14.3D10 mRNA was reverse transcribed to cDNA using Display Thermo-RT® (Display Systems Biotech) according to the supplied protocol utilising a PFI-013 gene specific primer PFI-013-rt (SEQ ID NO: 5). PFI-013 specific primers (PFI-013 forward and PFI-013 reverse; SEQ ID NOS: 3 and 4, respectively) were employed in a PCR to amplify the PFI-013 coding region from the
- 15 AML14.3D10 cDNA, where the conditions were as follows:-

PCR mix:

	PFI-013 primers	1 μ l (1 μ M final concentration)
20	AML14.3D10 cDNA	2 μ l (1/10 th of cDNA stock)
	dNTPs (concentration as per kit)	1 μ l
	Elongase Polymerase (LTI, Inc.)	1 μ l
	Buffer B (from Elongase kit)	10 μ l
	DMSO	5 μ l
25	dH ₂ O	30 μ l

PCR primers:

Forward Primer (= PFI-013 forward):

- 30 5'- ACCATGCCAGATACTAATAGCACAATC-3' (SEQ ID NO: 3)

Reverse Primer (= PFI-013 reverse):

5'- TTAAGAAGATACTGACCGACTGTG-3' (SEQ ID NO: 4)

Reverse Transcription Primer:

5 5'-GGGCAAGATAAAGGGCAGACCAGAT-3' (SEQ ID NO: 5)

PCR cycle:

(1) 94°C 1min

10 (2) 60°C 1.5 mins

(3) 68°C 3 mins

Steps (1) through to (3) were repeated for a further 34 cycles.

(4) 68°C 10 mins

(5) 4°C soak.

15

The PFI-013 PCR product was gel extracted using the QIAgen gel extraction kit, according to the manufacturer's instructions. The resultant product was TA cloned (Invitrogen TA cloning methodology) into the vector pcDNA3.1/V5-His-TOPO (Invitrogen), according to the manufacturer's instructions. The resulting insert was
20 subsequently sequence-verified on both strands using ABI DNA sequencing methodology as per the manufacturer's protocol.

Example 4

25 TISSUE DISTRIBUTION OF PFI-013

(a) Northern blot

(i) Probe production

30

A 261 bp fragment towards the 3' end of PFI-013 gene was PCR amplified using the following primers:

PCR primers:

PFI-013F: 5'-TCCTTCTCCCAATCAGATTCTGTAGC-3' (SEQ ID NO: 6)

5

PFI-013B: 5' -GTATCCATTGTGTCACAAGCGC-3' (SEQ ID NO: 7)

PCR mix:

10	PFI-013 primers	5 µl each (1µM final concentration)
	PFI-013 plasmid	1 µl (50 ng)
	dNTPs (concentration as per kit)	1 µl
	Advantage Polymerase (Clontech)	1 µl
	Buffer N (from Invitrogen optimiser kit)	10 µl
15	dH ₂ O	28 µl

PCR cycle:

(1) 94°C 1min

20 (2) 68°C 1.5 mins

Steps (1) and (2) were repeated for a further 29 cycles.

(3) 68°C 10 mins

(4) 4°C soak.

- 25 The PCR reaction was electrophoresed through a 0.8% agarose gel processed in x1 TAE buffer (Tris-Acetate-EDTA buffer, pH8.3; Sigma). The resulting band was excised from the gel using a Qiaquick® Gel extraction kit (Qiagen) according to the manufacturer's recommendations, in a 50 µl volume of 10 mM Tris-Cl pH8.0. 5 µl of the purified PCR product was labelled with ³²P-dCTP using Amersham Random Prime.
- 30 Kit (Amersham Pharmacia Biotech), according to the manufacturer's recommendations, and subsequently purified using a Chromaspin Spin + TE-30 column (Clontech).

(ii) *Hybridisation*

Human & Human II Multiple tissue Northern Blots (MTNs – Clontech) were pre-hybridised at 68°C for 1hr with 25 ml of Express Hyb solution (Clontech). The PFI-013 probe was added to a further 25 ml of pre-heated (68°C) Express Hyb solution. The pre-hybridisation solution was decanted from the membranes, and the hybridisation solution was added to the membranes. The membranes were incubated at 68°C for 16 hrs. The membranes were washed twice with x0.5 SSPE/0.1% SDS at 68°C and then exposed to BioMAX Autoradiography film (Kodak) for 1 week at -80°C.

The results are shown in Figure 4. Greatest level of PFI-013 mRNA expression was observed in peripheral blood leukocytes (PBLs) with detectable expression in spleen, testis, and colon.

(b) **Taqman® quantitative PCR analysis**

A standard curve reaction was used to quantify PFI-013 expression, using a 0.55 µg/µl plasmid solution of pcDNA3.1 containing the PFI-013 coding sequence. The plasmid solution was serially diluted in log steps to 10⁻¹². The standard curve was set up using this dilution for 2-200,000 copies/well. 300 nM of each primer (PFI-013F-taq (SEQ ID NO: 8) and PFI-013R-taq (SEQ ID NO: 9)) and 150 nM of PFI-013CP (SEQ ID NO: 10) were used with 2X TaqMan® Universal PCR Master Mix (Applied Biosystems). 1 ng of cDNA from Multiple Tissue cDNA (MTC™) Panels, Human I and Human II (Clontech), were used as the templates. The reaction was run on the TaqMan® 7700 Sequence Detection System as a single reporter, real time quantitation with 25 µl reaction volume and every point in triplicate. PCR conditions were: 50°C for 2 min, 95°C for 10 min, then 95°C for 15 sec, 60°C for 1 min for 40 cycles. The results were analysed by the sequence detection software. The baseline, i.e. the background for the fluorescence readings, was set to 3-12 cycles. The results file was exported to Excel (Microsoft), and the standard curve regenerated with the detection parameters from the results file. Results are expressed as copy number of PFI-013 transcripts per 1 ng of tissue cDNA, with error bars representing the standard deviation (see Figure 5).

PCR primers used:

PFI-013F-taq: 5'-AATATTTTATTGGAGCCTGTGGAA-3' (SEQ ID NO: 8)

5

PFI-013R-taq: 5'-GGAAGAGACAGCAGTCAGTCCA-3' (SEQ ID NO: 9)

PFI-013CP: 5'-FAM-ACACAAAGGATATCAGCGAAAGGCAAGCC-TAMRA-3'
(SEQ ID NO: 10)

10

The results are shown in Figure 5. The quantitative PCR results support the Northern blot data, in that the greatest level of expression was observed in peripheral blood leukocytes (P.B.Leukocyte), followed by spleen and testis; with low levels of expression detected in the remaining samples.

15

Example 5**LIGAND-BINDING ASSAY**

20 2 x 10⁸ CHO-K1 cells were transfected with pcDNA3.1/V5-His-TOPO-PFI-013 or mock-transfected, using Lipofectamine Plus (Gibco-BRL) according to manufacturer's recommendations. After incubation for 48 hours post-transfection, crude membrane preparations were made as follows: The cells were harvested by scraping, resuspended in 20 ml of ice-cold assay buffer (50 mM Tris-HCl (pH 7.4)), homogenised, and the
25 resulting suspension was centrifuged at 20,000g, 4°C for 30 minutes. The supernatant was decanted, pellet resuspended in 3 ml of assay buffer and re-homogenised (50 mM Tris-HCl pH7.4). Protein concentration was determined via Bradford's assay (Biorad), according to the manufacturer's recommendations.

30 Aliquots of this membrane preparation containing 200 µg protein were then incubated with various concentrations of ³H-histamine (e.g. 0.72-1500 nM; ³H-histamine obtained from Amersham Pharmacia Biotech) for 2 hrs at 30°C. To terminate incubations,

samples were rapidly filtered using the Brandell cell harvester onto Wallac Filtermats (Perkin Elmer) (which had been previously soaked (for 1h) in a 0.3% (v/v) solution of PEI (polyethylenimine; Sigma) in assay buffer to reduce Filtermat binding). Immediately, the Filtermat/wells were washed four times in rapid succession with 2 ml of assay buffer per well. Filtermats were dried using a microwave oven, and Meltilex scintillant (Perkin Elmer) was melted onto the Filtermats using the Wallac Meltilex heat sealer. The bound radioactivity on the Filtermats was determined using the Wallac betaplate scintillation counter.

- 10 The data were expressed as the difference between radioactivity bound to the membranes from PFI-013-transfected and mock-transfected cells.

Preliminary data, shown in Figure 6, suggest that histamine binds to PFI-013, albeit with relatively low affinity.

15

Example 6

FUNCTIONAL CELL-BASED ASSAYS FOR HISTAMINE AND HISTAMINE AGONIST ACTIVATION OF PFI-013

20

Fluorescence Imaging Plate Reader (FLIPR®) technology was employed as a means to detect activation of PFI-013 by histamine or histamine agonists in a cell-based assay.

- 25 5×10^6 Human Embryonic Kidney (HEK) 293 cells expressing the mouse $G\alpha_{15}$ gene (from here on called '293 cells'), were transiently transfected with 7.5 μ g of PFI-013 (contained within the pcDNA4HISmaxB (Invitrogen) plasmid) vector, or vector alone, using Lipofectamine Plus® reagent (Gibco BRL) as per the manufacturer's protocol. The PFI-013 cDNA had been cloned into pcDNA4HISmaxB using restriction sites *KpnI* and *NotI* to excise the PFI-013 cDNA from pcDNA3.1/V5-His-TOPO and to insert the cDNA into pcDNA4HISmaxB using standard molecular biology techniques (e.g. according to Sambrook, *et al.*, eds. (1989) Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory Press, New York, NY, USA) and using T4 DNA ligase
- 30

to join the fragments; pcDNA4HISmaxB was used as it contains elements that up-regulate the level of gene transcription over standard pcDNA3.1 vectors). 24 hrs post-transfection, the cells were detached from the flask using Trypsin/EDTA solution (LTI) and seeded into a black sided, Poly-D-lysine-treated, 96-well plate (Becton Dickinson) at 5×10^4 cells/well density. The plates were left overnight to allow the cells to adhere to the bottom of the wells. The medium was removed from the cells and replaced with 100 μ l warm (37°C) dye loading solution (50 μ g Fluo3 (Molecular probes) in 20 μ l DMSO + 20% pluronic acid in DMSO, added to 11 ml Dulbecco's Modified Eagles Medium containing 1x Probenecid (100x Probenecid - 0.71 g Probenecid was dissolved in 5 ml 1M NaOH and 5 ml Dulbeccos' Phosphate Buffered Saline (PBS), per plate; Probenecid (Molecular Devices) inhibits activity of the anion transport protein, thus improving dye loading). The plates were then incubated for 1 hr at 37°C. Plates were subsequently washed with 250 μ l of wash buffer per well (5 ml 100x Probenecid stock + 495 ml PBS, pH 7.4) 4 times. The plates were returned to the 37°C/5%CO₂ incubator for 30 mins prior to processing within the FLIPR® instrument. The FLIPR® processing involved reading the fluorescence for all samples for 2 minutes; during this time the fluorescence baseline was determined for 10 seconds. The desired amount of compound (i.e. histamine or histamine agonists) was then automatically transferred to the wells and the fluorescence was continuously monitored for the remainder of the time. All compounds were diluted in wash buffer.

(a) Histamine activation of PFI-013 in a FLIPR® cell-based assay

Using methodology as described in detail above, the effect of histamine on the functional activation of PFI-013 was investigated.

Figure 7 depicts the action of 10 μ M histamine dihydrochloride serially diluted in log concentrations down to 10 pM (columns 2 to 8) in duplicate (rows B and C), on PFI-013-transfected 293 cells (Figure 7A) or vector-only transfected 293 cells (Figure 7B). Remaining wells contained buffer only with no compound. A specific activation of PFI-013 by histamine was found at the 10 μ M concentration.

(b) **Analysis of PFI-013 activation by various histaminergic compounds in a FLIPR® cell-based assay**

Using methodology as described in detail above, the effect of histaminergic compounds
5 on the functional activation of PFI-013 was investigated.

Figure 8 depicts the action of various histaminergic compounds (columns 2 to 10)
serially diluted from 10 μ M (rows A and B) down to 0.5 μ M in duplicate (rows G and
H), on PFI-013-transfected 293 cells (Figure 8A) or vector-only transfected 293 cells
10 (Figure 8B). Remaining wells contained buffer only with no compound.

The results indicate that PFI-013 is activated, in a rank order of potency, by N- α -methyl
histamine (column 6) > histamine (column 4) > R- α -methyl histamine (column 5) =
histamine-1-methyl (column 8). For the remaining compounds tested (Dimaprit,
15 L-histidine, Imetit, nospapine and clobenpropit, respectively columns 2, 3, 7, 9 and 10),
no activation of PFI-013 could be detected in this assay.

Example 7

20 **EOSINOPHIL CHEMOTAXIS STUDIES**

Eosinophils were isolated from peripheral blood as previously described (Hansel, TT.,
De Vries JJ., Iff T., Rihs S., Wandzilak M., Betz S., Blaser K. and Walker C. (1991). An
improved immunomagnetic procedure for the isolation of highly purified human blood
25 eosinophils. J. Imm. Meth. 145:105-10). Chemotaxis was measured using a 48-well
Boyden chamber (Neuro Probe Inc., Cabin John, MD, USA). Agonists were diluted in
RPMI media (BioWhittaker, Walkersville, MD, USA) containing 0.1% bovine serum
albumin (BSA) (Gibco BRL, Gaithersburg, MD, USA) and added to the bottom wells of
the chemotaxis chamber. A 5 μ m PVP-free polycarbonate filter was used to separate
30 the wells of the chamber (Neuro Probe Inc., Cabin John, MD, USA). Eosinophils were
resuspended in RPMI/BSA media at a concentration of 2.5×10^6 cells per ml. 50 μ l of
this cell suspension were then added to the upper chamber. Chambers were incubated

for 45 minutes in a 5% CO₂-humidified atmosphere at 37°C. After the incubation period, the filters were removed, the top side was scraped to remove non-migrating cells, and the filters were stained with Diff-Quik stain (Dade Behring AG, Duding, Switzerland). The number of cells migrating (bottom of filter) were counted by light microscopy. The mean of three high-powered fields was then determined. The number of migrating cells was calculated by subtracting this number from the number of cells per high-powered field in those wells not containing any agonist. All compounds were purchased from Sigma-RBI.

10 (a) **Effect of histamine receptor subtype-selective agonists on human eosinophil chemotaxis**

Experiments were performed to characterise the histamine receptor subtype involved in the eosinophil chemotactic response to histamine. Methodology was as detailed above.

15 Compounds tested were: histamine dihydrochloride (non-selective histamine receptor agonist), histamine free base, HTMT dimaleate (histamine H1 agonist), Dimaprit (histamine H2 agonist) and Imetit (histamine H3 agonist). Eotaxin was included as a positive control for eosinophil chemotaxis. Burimamide was included in the study, as previously Raible *et al.* had described a partial agonist effect of this compound on

20 intracellular Ca²⁺ production in isolated human eosinophils (Raible D.G. *et al* (1994) Pharmacological characterisation of a novel histamine receptor on human eosinophils, Am J Respir Crit Care Med, 149, pp1506-1511).

The results are shown in Figure 9. Only the non-selective histamine receptor agonist, histamine dihydrochloride, induced a significant chemotactic response from isolated human eosinophils in an *in vitro* assay. The H2 agonist, dimaprit, and the H3 agonists, imetit and burimamide, displayed no chemotactic activity, whilst the H1 agonist, HTMT, displayed a very weak chemotactic response only at the highest concentration tested (1 µM).

(b) **Effect of histamine receptor subtype-selective antagonists on human eosinophil histamine-induced chemotaxis**

Antagonist experiments were performed to further characterise the histamine receptor subtype involved in the eosinophil chemotactic response to histamine. Methodology was as detailed above, except that IL-5 was utilised to prime the eosinophils for chemotaxis studies as this was shown to enhance the chemotactic response to histamine (see Figure 10A). Antagonists were used at a single concentration of 10 μ M. Antagonists tested were: mepyramine maleate (histamine H1 antagonist), cimetidine (histamine H2 antagonist), thioperamide (histamine H3 antagonist) and clobenpropit (histamine H3 antagonist).

The results, shown in Figure 10B, indicate that the two H3 antagonists, thioperamide and clobenpropit, had the greatest effect on the reduction of the chemotactic response of isolated human eosinophils to histamine dihydrochloride.

(c) **Determination of the IC_{50} of histamine H3 receptor antagonists for inhibiting isolated human eosinophil *in vitro* chemotaxis**

A further experiment was performed to determine the IC_{50} of both thioperamide and clobenpropit (histamine H3 antagonists) for inhibiting isolated human eosinophil *in vitro* chemotaxis. Methodology was as above, using thioperamide and clobenpropit at 10 μ M, 1 μ M and 0.1 μ M concentrations (Histamine, as the agonist, was used at 30 nM).

Preliminary results, shown in Figure 10C, indicate that clobenpropit and thioperamide antagonise histamine-induced chemotaxis of human eosinophils with an IC_{50} of 1.5 μ M and 0.83 μ M respectively.

It will be appreciated that the foregoing is provided by way of example only and modification of detail may be made without departing from the scope of the invention.

Claims

1. An isolated and/or purified polynucleotide comprising one or more of:
 - 5 (a) a polynucleotide encoding the polypeptide as set forth in SEQ ID NO: 2;
 - (b) a polynucleotide comprising a nucleotide sequence of SEQ ID NO: 1;
 - (c) a polynucleotide encoding the polypeptide expressed by the DNA contained in NCIMB 41073;
 - (d) a polynucleotide comprising a nucleotide sequence that has at least 70%
10 identity to the polynucleotide of any one of (a) to (c);
 - (e) a polynucleotide comprising a nucleotide sequence which is capable of hybridising to the polynucleotide of any one of (a) to (d);
 - (f) a complement to the polynucleotide of any one of (a) to (e); or
 - (g) a polynucleotide fragment of the polynucleotide of any one of (a) to (f).
- 15 2. The polynucleotide of claim 1, comprising a nucleotide sequence that has at least 75% identity to the polynucleotide of any one of (a) to (c).
3. The polynucleotide of claim 1, comprising a nucleotide sequence that has at least
20 80% identity to the polynucleotide of any one of (a) to (c).
4. The polynucleotide of claim 1, comprising a nucleotide sequence that has at least 85% identity to the polynucleotide of any one of (a) to (c).
- 25 5. The polynucleotide of claim 1, comprising a nucleotide sequence that has at least 90% identity to the polynucleotide of any one of (a) to (c).
6. The polynucleotide of claim 1, comprising a nucleotide sequence that has at least 95% identity to the polynucleotide of any one of (a) to (c).
- 30 7. The polynucleotide of any one of the preceding claims which encodes a G-protein coupled receptor (GPCR).

8. A polynucleotide probe or primer comprising at least 15 contiguous nucleotides of the polynucleotide of any one of the preceding claims.
- 5 9. A vector comprising the polynucleotide of any one of the preceding claims.
10. A host cell transformed or transfected with the vector of claim 9.
11. The transformed/transfected host cell of claim 10 which is a mammalian, insect,
10 fungal, bacterial or yeast cell.
12. The transcribed RNA product of the polynucleotide of any one of claims 1 to 8.
13. An RNA molecule or a fragment thereof which is antisense in relation to the
15 RNA product of claim 12 and is capable of hybridising thereto.
14. A ribozyme or zinc finger protein capable of binding to the polynucleotide of any one of claims 1 to 8.
- 20 15. A process for producing a polypeptide or fragment thereof comprising culturing the transformed/transfected host cell of claim 10 or claim 11 under conditions sufficient for the expression of said polypeptide or fragment.
16. The process of claim 15, wherein said polypeptide or fragment is expressed at
25 the surface of said cell.
17. The process of claim 15 or claim 16 which further includes recovering the polypeptide or fragment from the culture.
- 30 18. A process for producing cells capable of expressing a polypeptide or fragment thereof comprising transforming or transfecting cells with the vector of claim 9.

19. Cells produced by the process of claim 18.
20. A membrane preparation of the cells of claim 19.
- 5 21. A polypeptide or a fragment thereof produced by the process of any one of claims 15 to 18.
22. A polypeptide comprising:
- 10 (a) a polypeptide having the deduced amino acid sequence translated from the polynucleotide sequence in SEQ ID NO: 1 and variants, fragments, homologues, analogues and derivatives thereof;
- (b) a polypeptide of SEQ ID NO: 2 and variants, fragments, homologues, analogues and derivatives thereof; or
- 15 (c) a polypeptide encoded by the cDNA of NCIMB 41073 and variants, fragments, homologues, analogues and derivatives thereof.
23. An antibody against the polypeptide of claim 22.
- 20 24. A compound which modulates the polypeptide of claim 22.
25. A compound according to claim 24 which antagonises or selectively antagonises the polypeptide of claim 22.
- 25 26. A compound according to claim 24 which agonises the polypeptide of claim 22.
27. A pharmaceutical composition comprising the antibody of claim 23 or the compound of any one of claims 24 to 26 and one or more pharmaceutically acceptable carriers, diluents, adjuvants or excipients.

28. A method for identifying a compound which binds to and modulates the polypeptide of claim 22 comprising contacting said polypeptide with a candidate compound and determining whether modulation occurs.
- 5 29. A method according to claim 28, which comprises:
- (a) contacting a compound with cells expressing the polypeptide of claim 22 on their surface, said polypeptide being associated with a second component capable of providing a detectable signal in response to the binding of a compound to said polypeptide; said contacting being under conditions sufficient to permit binding of compounds to the polypeptide; and
 - 10 (b) identifying a compound capable of polypeptide binding by detecting the signal produced by said second component.
- 15 30. A method according to claim 29, which comprises:
- (a) contacting (i) a detectable first component known to bind to the polypeptide of claim 22 and (ii) a compound, with cells expressing the polypeptide of claim 22 on their cell surface, said polypeptide being associated with a second component capable of providing a detectable signal in response to the binding of a compound to said polypeptide; said contacting being under conditions sufficient to permit binding of compounds to the polypeptide; and
 - 20 (b) determining whether the first component binds to the polypeptide by detecting the absence or otherwise of a signal generated from the interaction of the first component with the polypeptide.
- 25 31. A method according to any one of claims 28 to 30, wherein said compound binds to and antagonises or selectively antagonises the polypeptide of claim 22.
- 30

32. A method according to any one of claims 28 to 30, wherein said compound binds to and agonises the polypeptide of claim 22.
33. The antibody of claim 23; the compound of any one of claims 24 to 26, or the composition of claim 27 for use as a pharmaceutical.
34. Use of the compound of any one of claims 24 to 26 in the manufacture of a medicament for the treatment of a patient having need to modulate the polypeptide of claim 22.
35. Use according to claim 34, in the manufacture of a medicament for the treatment of a patient having need to antagonise or selectively antagonise the polypeptide of claim 22.
36. Use according to claim 34, in the manufacture of a medicament for the treatment of a patient having need to agonise the polypeptide of claim 22.
37. A method for the treatment of a patient having need to modulate the polypeptide of claim 22 comprising administering to the patient a therapeutically effective amount of the compound of any one of claims 24 to 26.
38. The method according to claim 37, wherein the method is for the treatment of a patient having need to antagonise or selectively antagonise the polypeptide of claim 22.
39. The method according to claim 37, wherein the method is for the treatment of a patient having need to agonise the polypeptide of claim 22.
40. The method according to any one of claims 37 to 39, wherein said compound is a polypeptide and a therapeutically effective amount of the compound is administered by providing to the patient DNA encoding said compound and expressing said compound *in vivo*.

41. Use of the antibody of claim 23 in the manufacture of a medicament for the treatment of a patient having need to modulate the polypeptide of claim 22.
- 5 42. Use according to claim 41, in the manufacture of a medicament for the treatment of a patient having need to antagonise or selectively antagonise the polypeptide of claim 22.
43. Use according to claim 41, in the manufacture of a medicament for the treatment
10 of a patient having need to agonise the polypeptide of claim 22.
44. A method for the treatment of a patient having need to modulate the polypeptide of claim 22, comprising administering to the patient a therapeutically effective amount of the antibody of claim 23.
- 15 45. The method according to claim 44, wherein the method is for the treatment of a patient having need to antagonise or selectively antagonise the polypeptide of claim 22.
- 20 46. The method according to claim 44, wherein the method is for the treatment of a patient having need to agonise the polypeptide of claim 22.
47. Use of the compound of any one of claims 24 to 26 in the manufacture of a medicament for the treatment of allergic disorders, vasculitic granulomatous
25 diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases.
48. Use according to claim 47, wherein said allergic disorder is extrinsic asthma,
30 said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.

49. Use of the antibody according to claim 23 in the manufacture of a medicament for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases.
- 5
50. Use according to claim 49, wherein said allergic disorder is extrinsic asthma, said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.
- 10
51. A method for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases, in a patient comprising administering to the patient a therapeutically effective amount of the compound of any one of claims 24 to
- 15
- 26.
52. The method according to claim 51, wherein said allergic disorder is extrinsic asthma, said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.
- 20
53. A method for the treatment of allergic disorders, vasculitic granulomatous diseases, immunological disorders, interstitial and other pulmonary diseases, infectious diseases, inflammatory diseases, and neoplastic and myeloproliferative diseases, in a patient comprising administering to the patient
- 25
- a therapeutically effective amount of the antibody of claim 23.
54. The method according to claim 53, wherein said allergic disorder is extrinsic asthma, said immunological disorder is intrinsic asthma, said pulmonary disease is COPD and said inflammatory diseases are inflammatory bowel diseases.
- 30
55. Use of the antibody according to claim 23 for the enrichment of eosinophils from mammalian blood.

56. Use according to claim 55, wherein said blood is human blood.
57. Cells genetically engineered *ex vivo* or *in vivo* to express, overexpress,
5 underexpress or to exhibit targeted insertion or deletion of the polypeptide of
claim 22.

NOVEL POLYPEPTIDE

Polynucleotide and polypeptide sequences are described. The polypeptide sequences comprise one or more of: (a) a polypeptide having the deduced amino acid sequence translated from the polynucleotide sequence in SEQ ID NO: 1 and variants, fragments, homologues, analogues and derivatives thereof; (b) a polypeptide of SEQ ID NO: 2 and variants, fragments, homologues, analogues and derivatives thereof; or (c) a polypeptide encoded by the cDNA of NCIMB 41073 and variants, fragments, homologues, analogues and derivatives thereof.
